Recent Hype#1: Transformers

- Transformers = neural network architectures stacking "attention" layers[1]
- Initially successful for natural language processing
- Then applied to computer vision[2]. Better performance than CNNs given enough data.
- The hype still continues today.
- What is attention?

[1] Vaswani et al. "**Attention is all you need",** NeurIPS 2017.
[2] Dosovitskiy et al. An image is worth 16x16 words: Transformers for image recognition at scale", ICLR 2021.

Attention

- Motivation: sequence-to-sequence models

$$\mathbf{Y} = \text{AttentionLayer}(\mathbf{Q}, \mathbf{K}, \mathbf{V})$$

$$\mathbf{Y} = \text{softmax}\left(\frac{\mathbf{Q}\mathbf{K}^\top}{\sqrt{d}}\right)\mathbf{V}$$

$$\mathbf{Y} = \mathbf{A}\mathbf{V}$$

$$Y_i = \sum_j A_{i,j} V_j$$

$$A_{i,j} = \text{softmax}\left(\frac{Q_i \cdot K_j}{\sqrt{d}}\right)$$

Attention

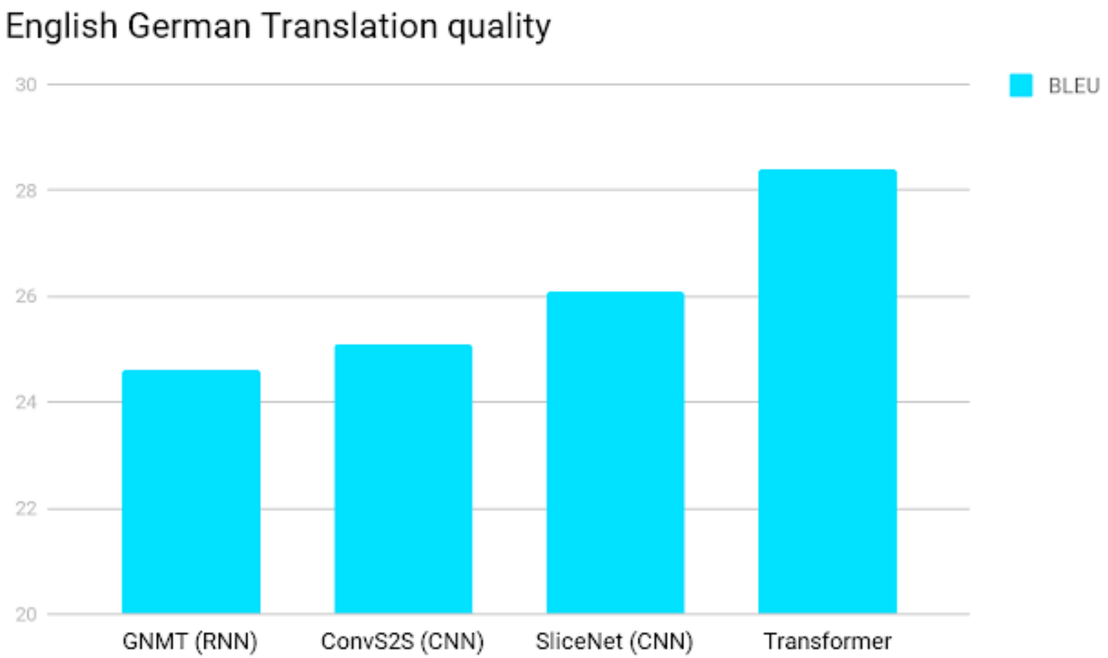
- Used to capture **context** *within the sequence*

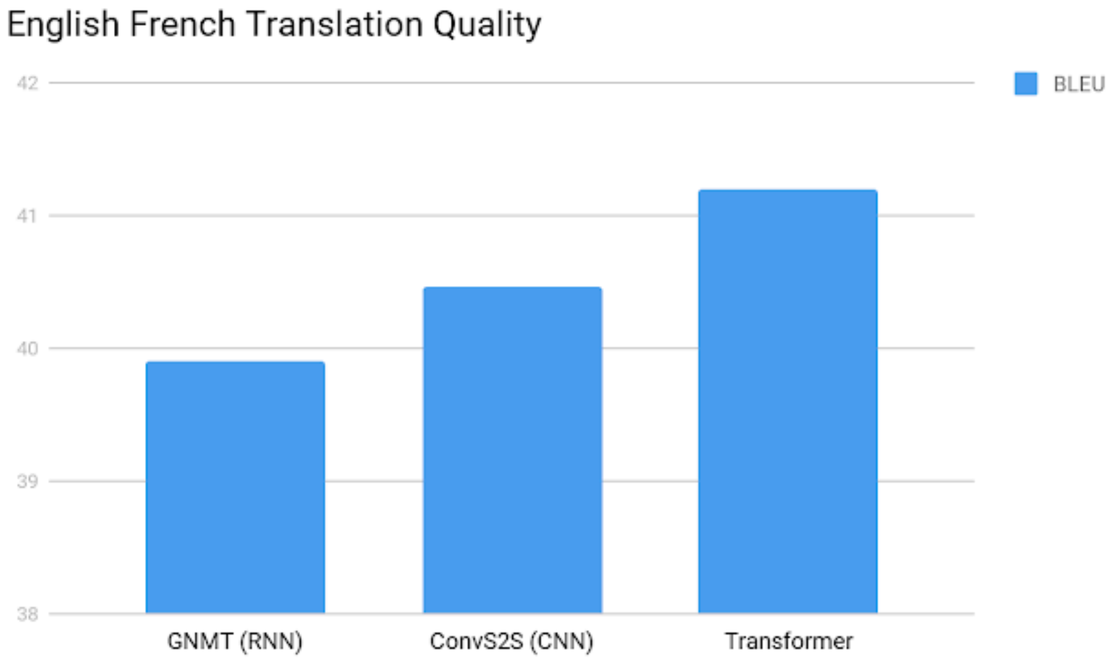
As we are encoding “it”, we should focus on “the animal”

As we are encoding “it”, we should focus on “the street”

Image source

Original transformer results on machine translation





https://ai.googleblog.com/2017/08/transformer-novel-neural-network.html

Attention

$$\mathbf{Y} = \text{AttentionLayer}(\mathbf{Q}, \mathbf{K}, \mathbf{V})$$

$$\mathbf{Y} = \text{softmax}\left(\frac{\mathbf{Q}\mathbf{K}^{\mathsf{T}}}{\sqrt{d}}\right)\mathbf{V}$$

$$\mathbf{Y} = \mathbf{A}\mathbf{V}$$

$$Y_i = \sum_j A_{i,j} V_j$$

$$A_{i,j} = \text{softmax}\left(\frac{Q_i \,.\, K_j}{\sqrt{d}}\right)$$

Attention

Query Key Value

$$\mathbf{Y} = \text{AttentionLayer}(\mathbf{Q}, \mathbf{K}, \mathbf{V})$$

$$\mathbf{Y} = \text{softmax}\left(\frac{\mathbf{Q}\mathbf{K}^\top}{\sqrt{d}}\right)\mathbf{V}$$

?

$$\mathbf{Y} = \mathbf{A}\mathbf{V}$$

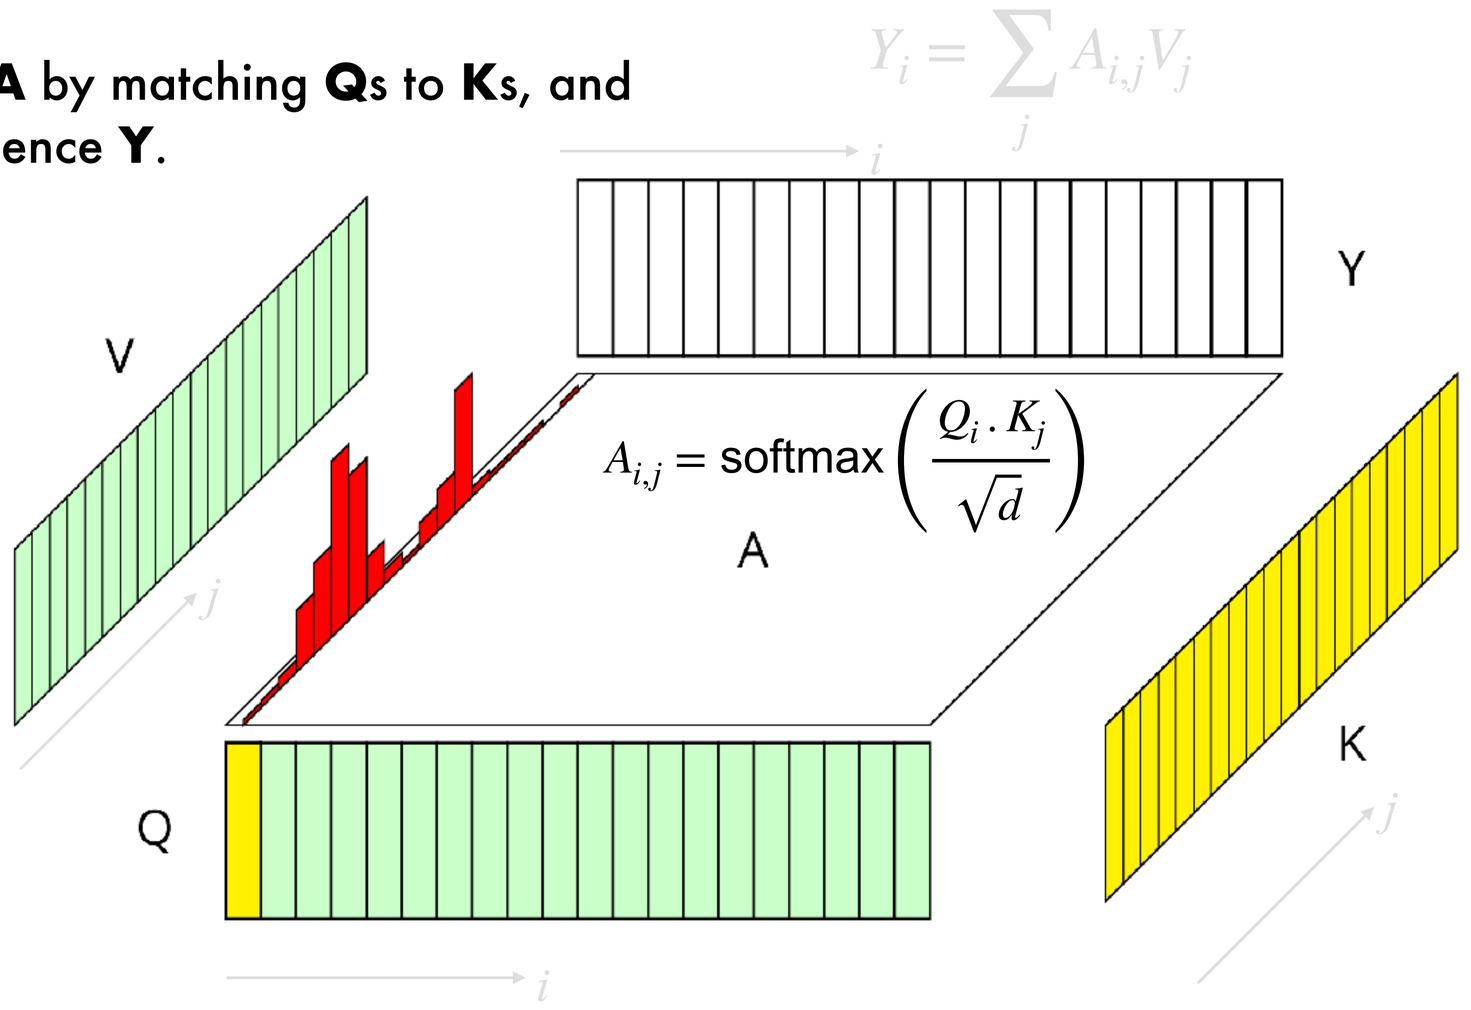
Output Attention

$$Y_i = \sum_j A_{i,j} V_j$$

$$A_{i,j} = \text{softmax}\left(\frac{Q_i \cdot K_j}{\sqrt{d}}\right)$$

Attention mechanism

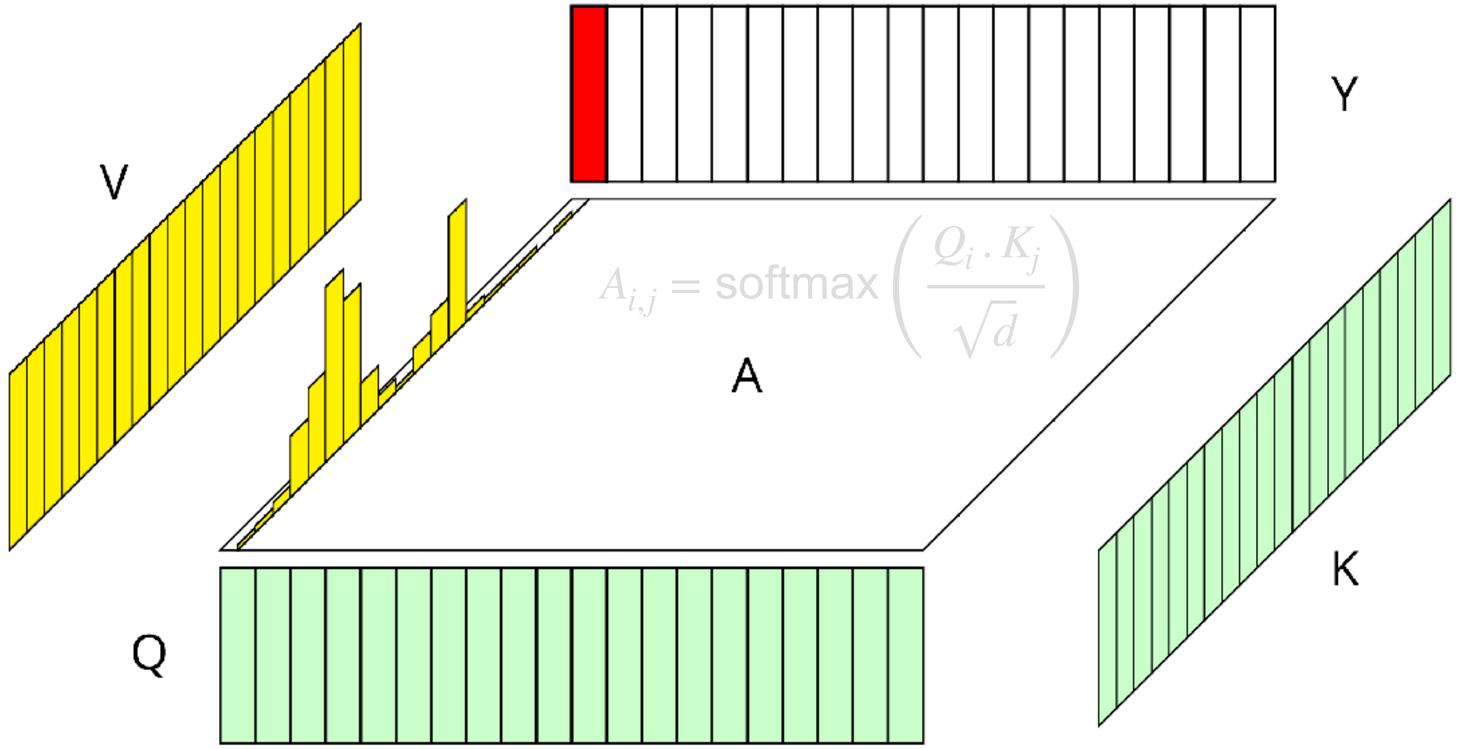
Given a **query** sequence **Q**,
a **key** sequence **K**, and
a **value** sequence **V**,
compute an attention matrix **A** by matching **Q**s to **K**s, and
weight **V** with to get the sequence **Y**.



Attention mechanism

Given a **query** sequence **Q**,
a **key** sequence **K**, and
a **value** sequence **V**,
compute an attention matrix **A** by matching **Q**s to **K**s, and weight **V** with to get the sequence **Y**.

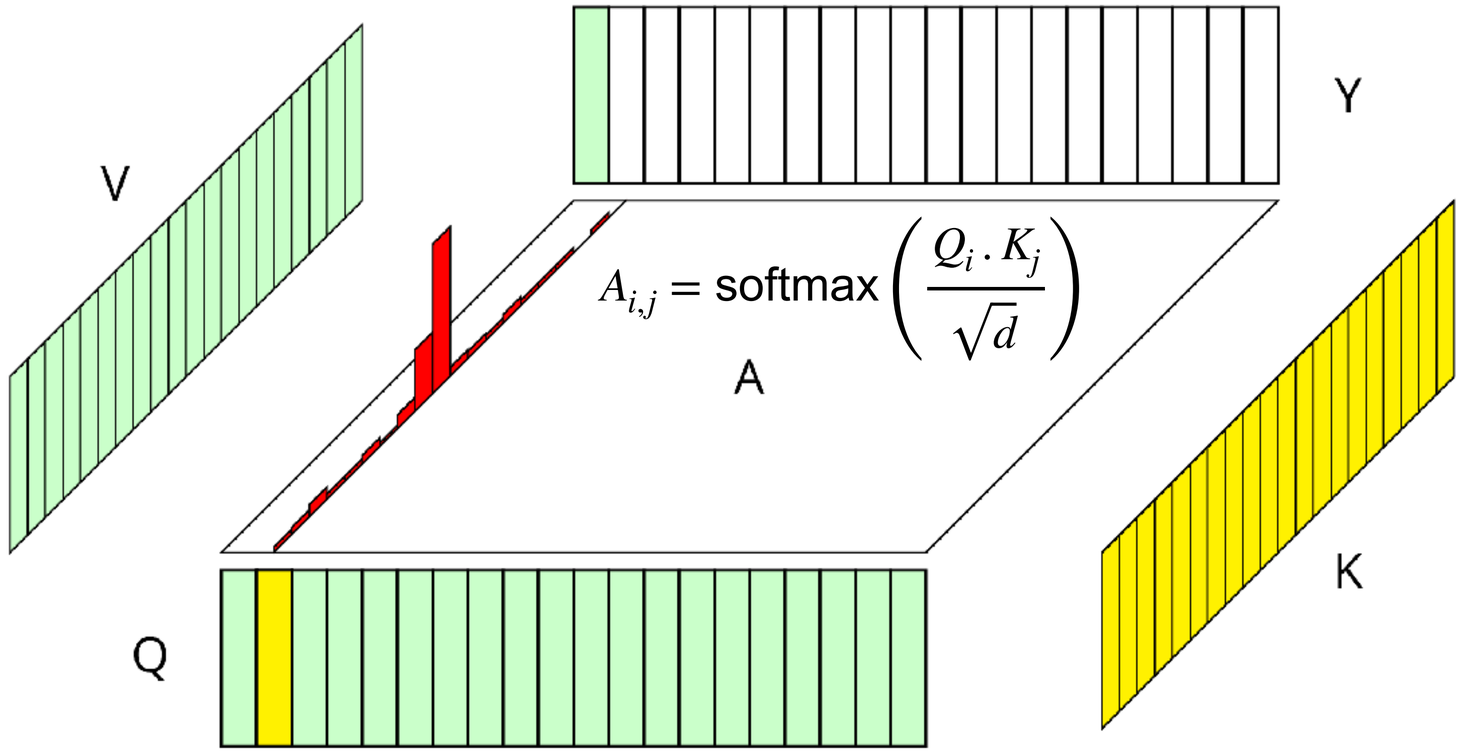
$$Y_i = \sum_j A_{i,j} V_j$$



Attention mechanism

Given a **query** sequence **Q**,
a **key** sequence **K**, and
a **value** sequence **V**,
compute an attention matrix **A** by matching **Q**s to **K**s, and
weight **V** with to get the sequence **Y**.

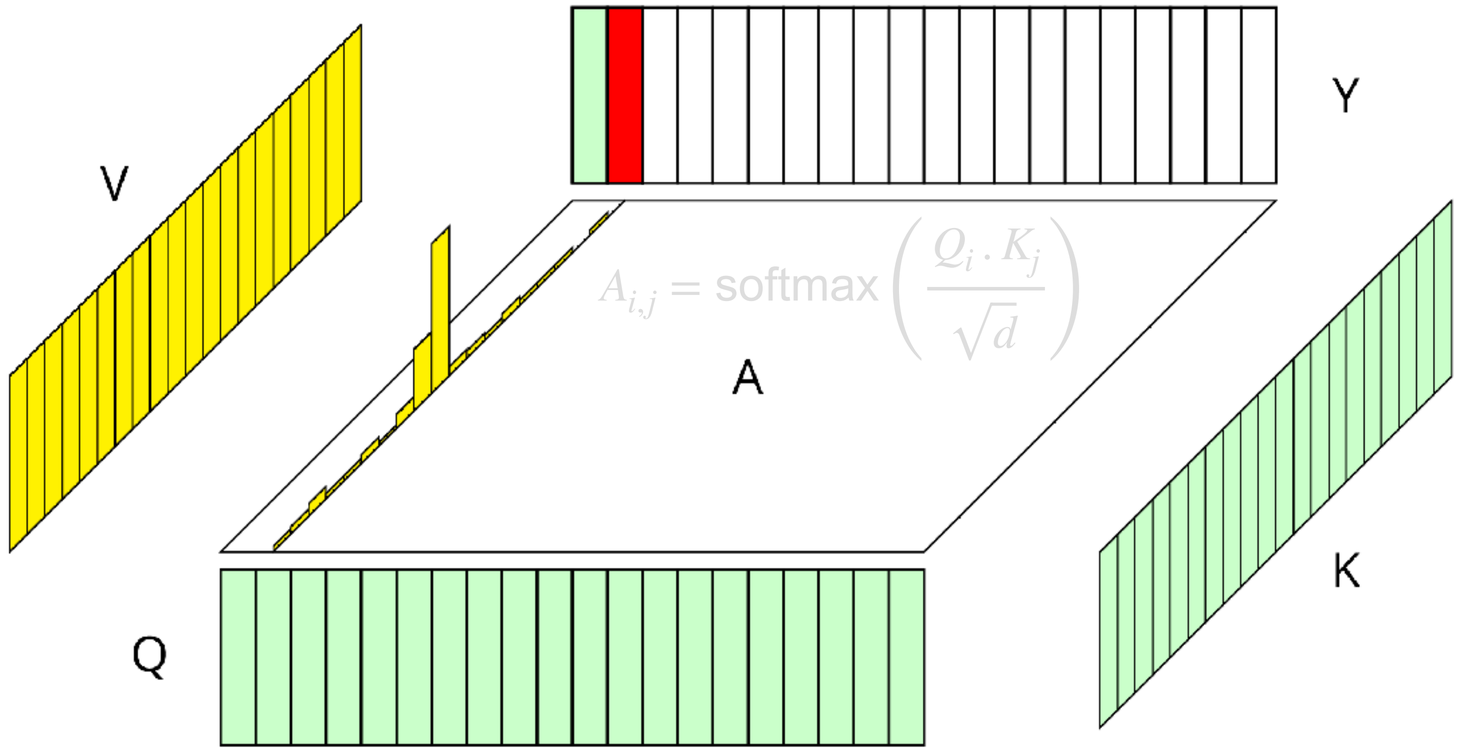
$$Y_i = \sum_j A_{i,j} V_j$$



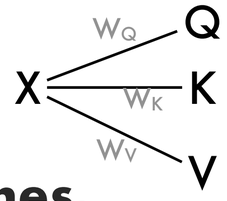
Attention mechanism

Given a **query** sequence **Q**,
a **key** sequence **K**, and
a **value** sequence **V**,
compute an attention matrix **A** by matching **Q**s to **K**s, and weight **V** with to get the sequence **Y**.

$$Y_i = \sum_j A_{i,j} V_j$$



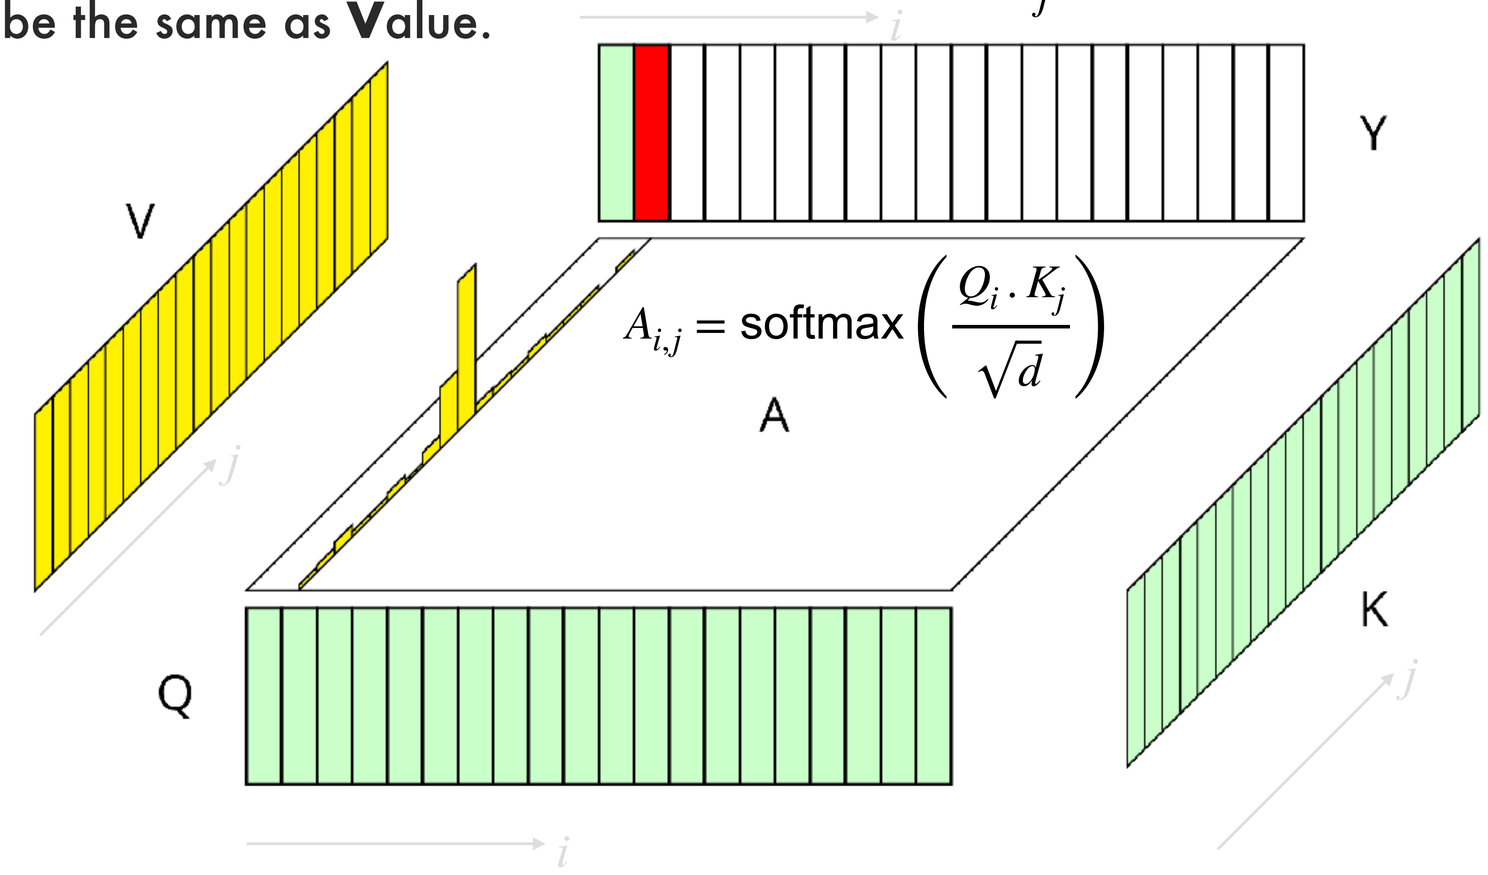
Attention mechanism



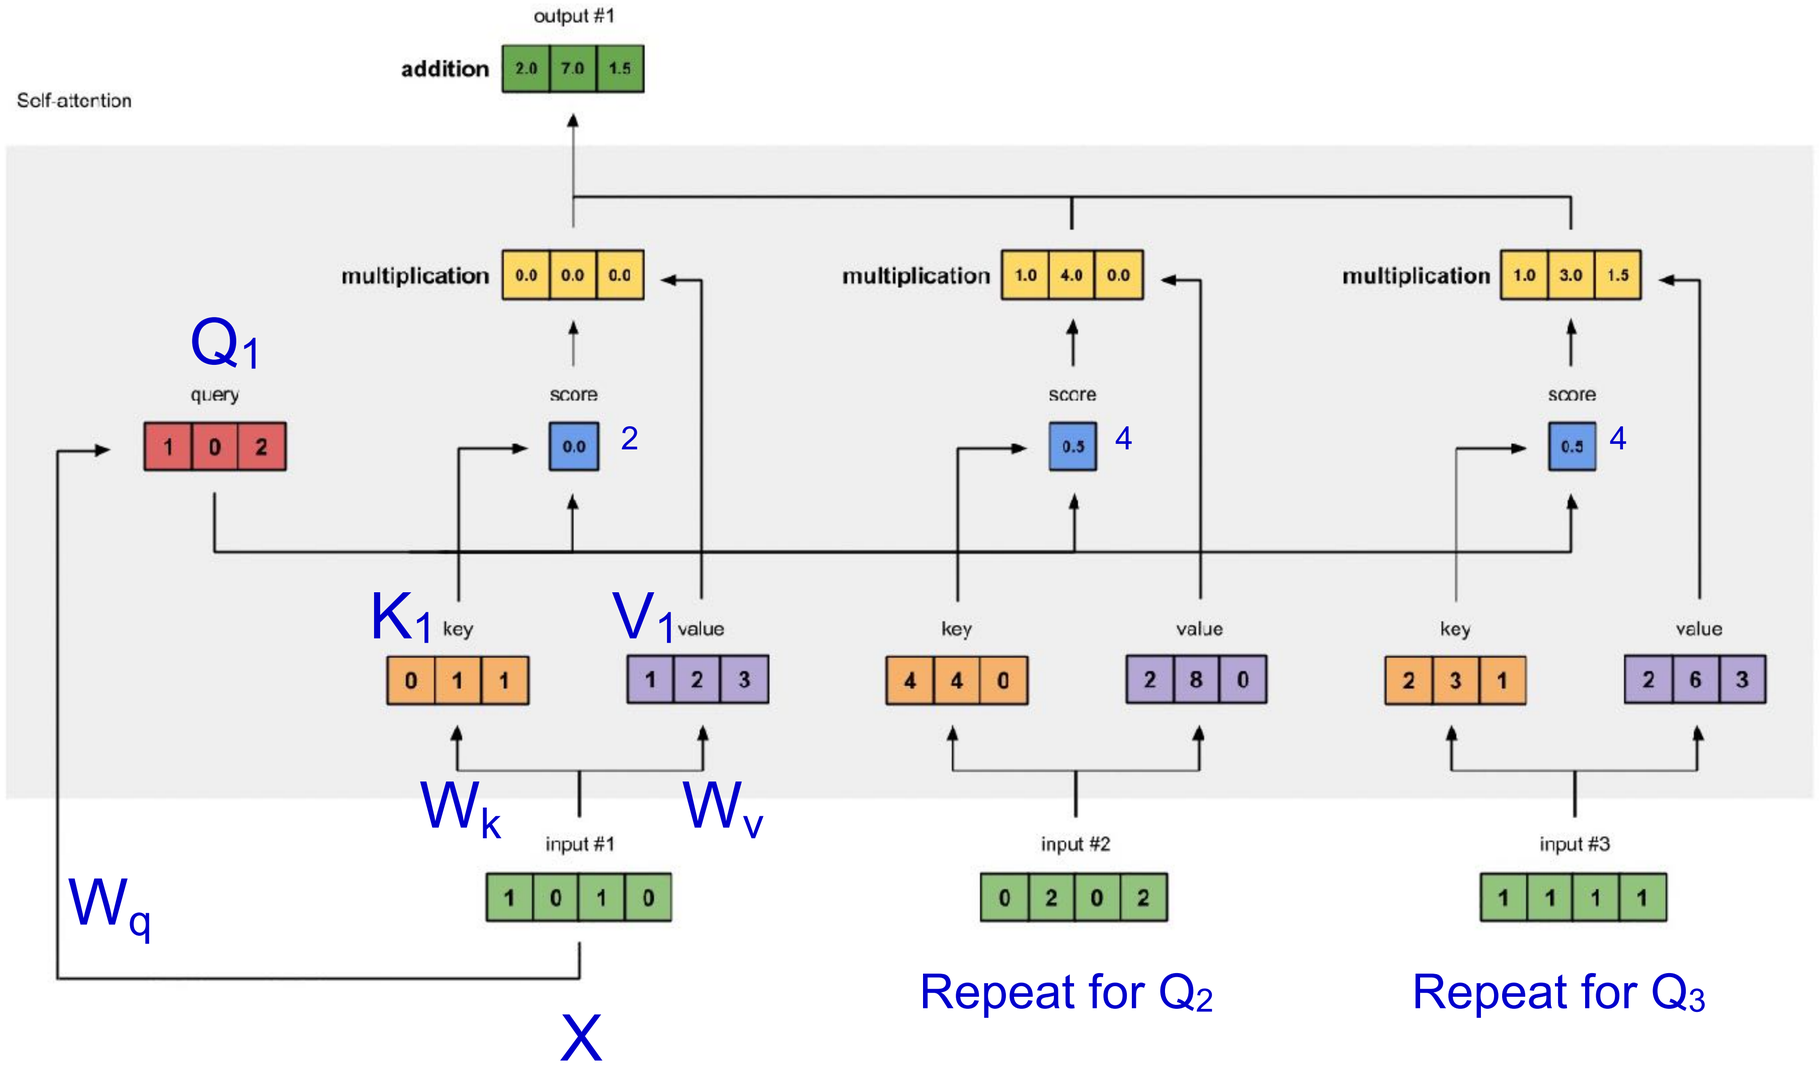
In "self-attention", (Q, K, V) obtained from the same input, linearly projected three times.

- **Q**uery and **K**ey dimensionalities are the same.
- **V**alue dimensionality may be different.
- Output dimensionality will be the same as **V**alue.

$$Y_i = \sum_j A_{i,j} V_j$$



Self-Attention Example



$$A_{i,j} = \text{softmax}\left(\frac{Q_i \cdot K_j}{\sqrt{d}}\right) \qquad Y_i = \sum_j A_{i,j} V_j$$

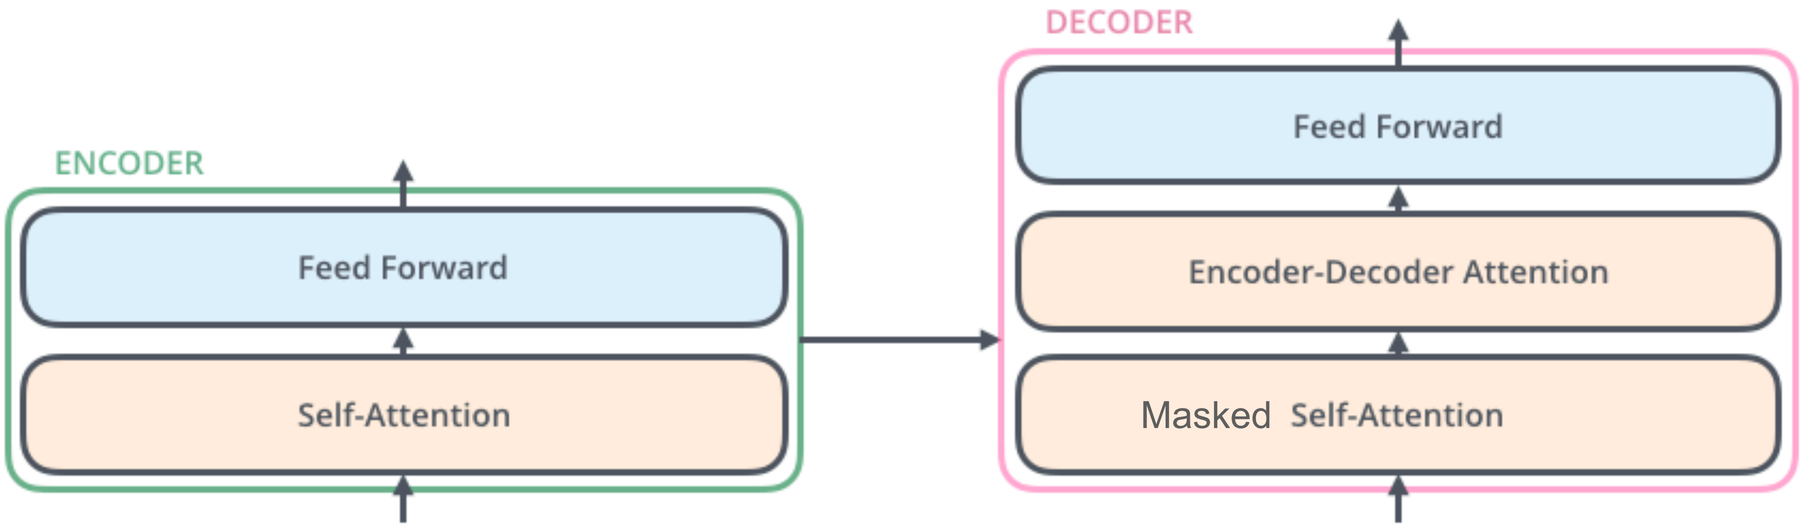
https://towardsdatascience.com/illustrated-self-attention-2d627e33b20a

Basic transformer model

- Sequence-to-sequence architecture using only point-wise processing and attention (no recurrent units or convolutions)

Encoder: receives entire input sequence and outputs encoded sequence of the same length

Decoder: predicts next token conditioned on encoder output and previously predicted tokens



NLP application: Machine Translation

A. Vaswani, N. Shazeer, N. Parmar, J. Uszkoreit, L. Jones, A. Gomez, L. Kaiser, I. Polosukhin, Attention is all you need, NeurIPS 2017

Image source

Key-Value-Query attention model

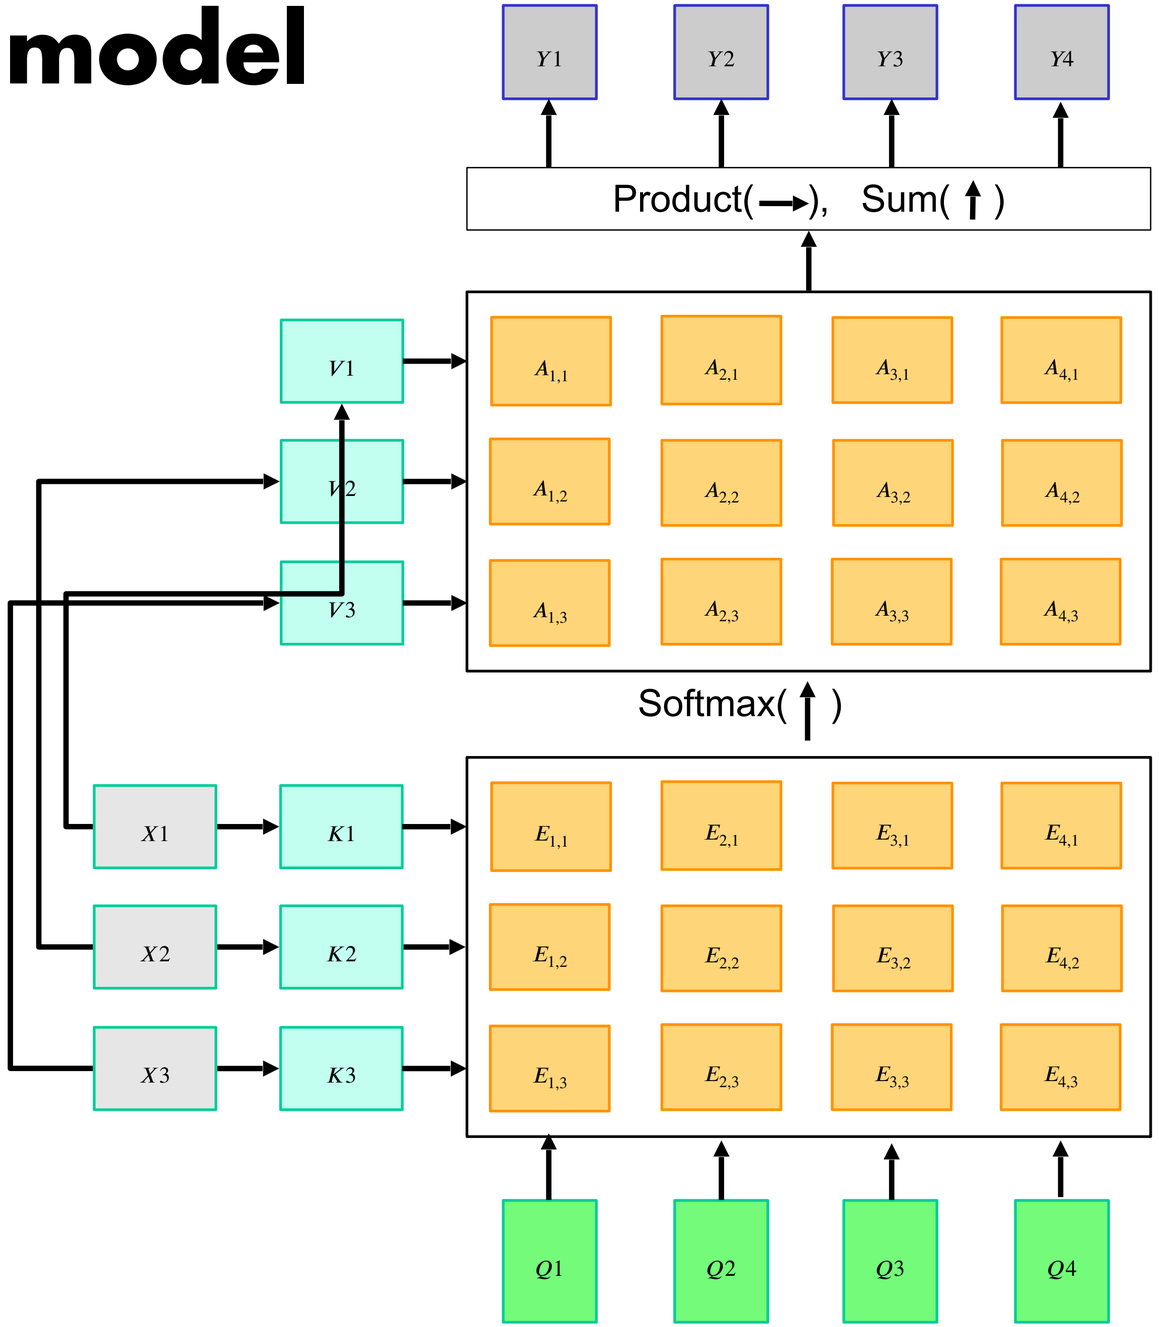
- Key vectors: $K = XW_K$
- Value Vectors: $V = XW_V$
- Query vectors
- Similarities: *scaled dot-product attention*

$$E_{i,j} = \frac{\left(Q_i \cdot Kj\right)}{\sqrt{D}} \text{ or } E = QK^T/\sqrt{D}$$

(D is the dimensionality of the keys)

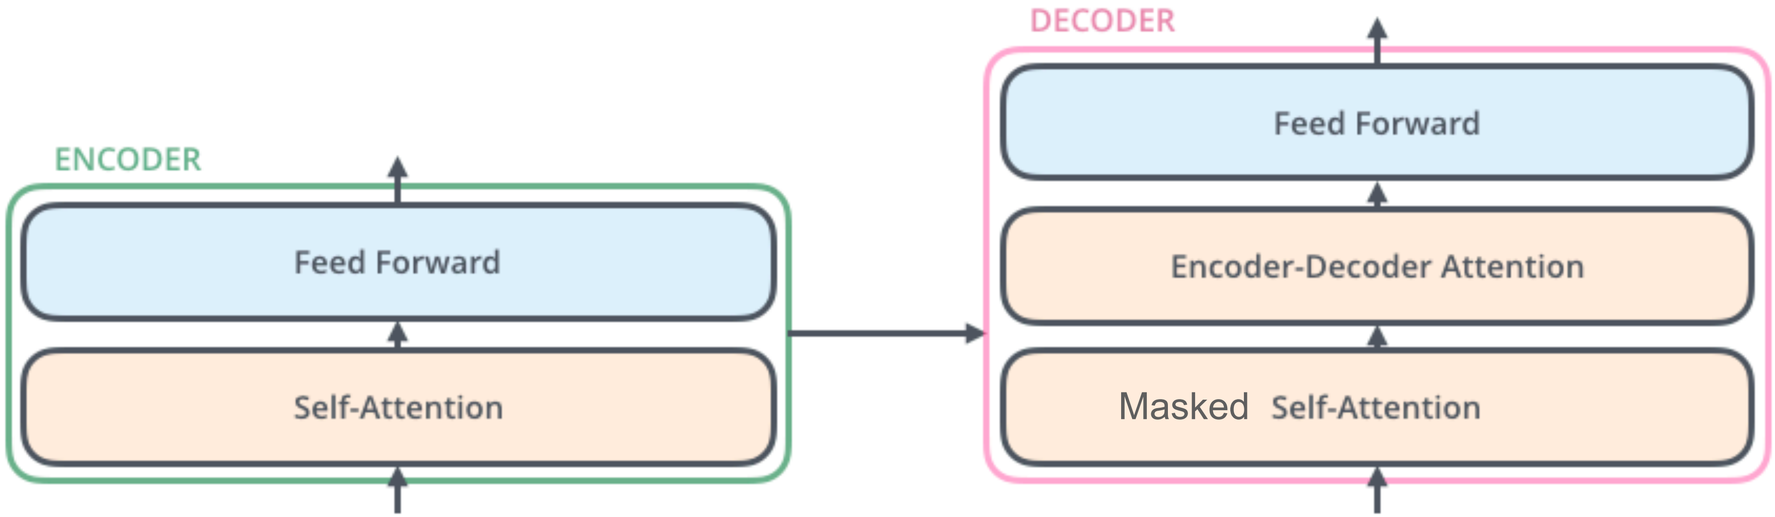
- Attn. weights: $A = \text{softmax}(E, \text{dim} = 1)$
- Output vectors:

$$Y_i = \sum_j A_{i,j} V_j \text{ or } Y = AV$$



Adapted from J. Johnson

Attention mechanisms



- **Encoder self-attention:** queries, keys, and values come from previous layer of encoder
- **Decoder self-attention:** values corresponding to future decoder outputs are masked out
- **Encoder-decoder attention:** queries come from previous decoder layer, keys and values come from output of encoder

Self-attention

- Used to capture context *within the sequence*

As we are encoding “it”, we should focus on “the animal”

As we are encoding “it”, we should focus on “the street”

Image source

Self-attention layer

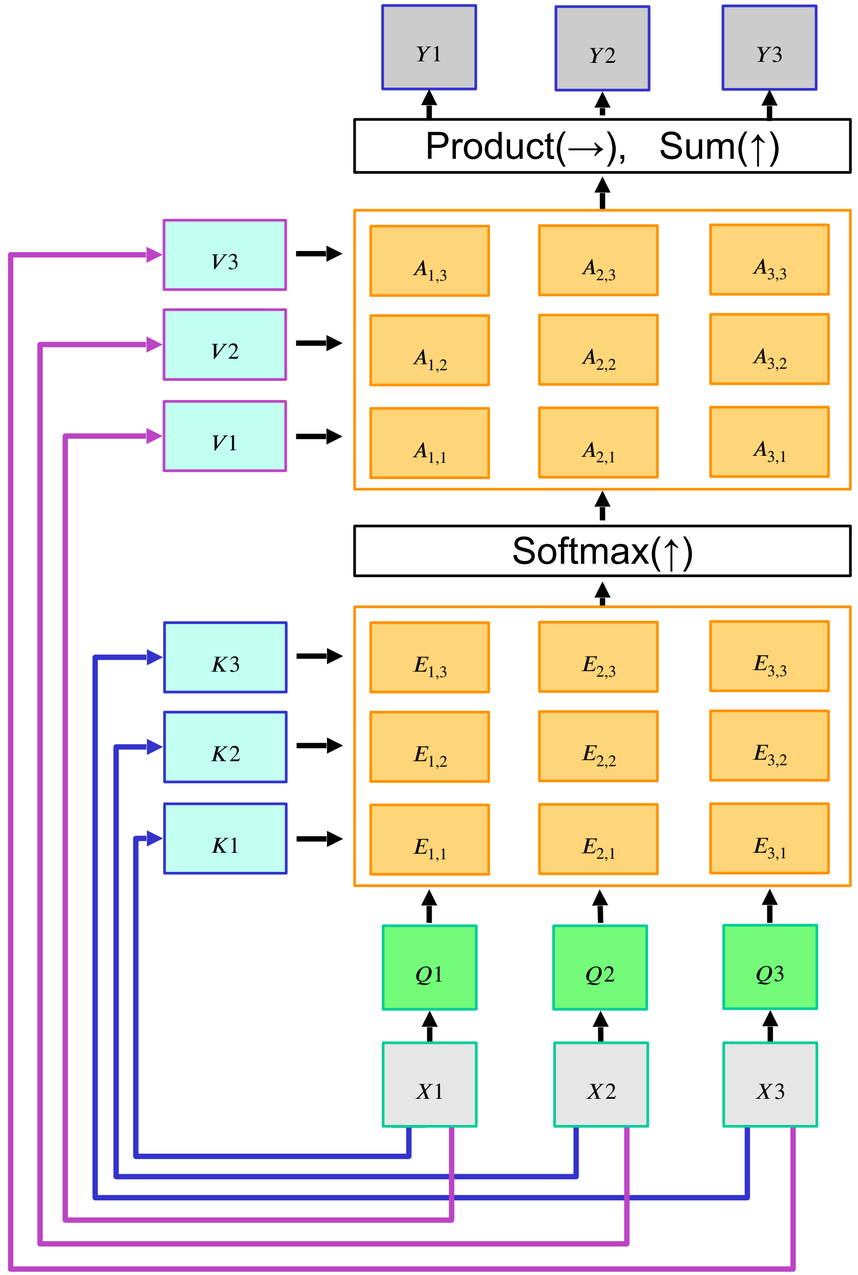
- Query vectors: $Q = XW_Q$
- Key vectors: $K = XW_K$
- Value vectors: $V = XW_V$
- Similarities: *scaled dot-product attention*

$$E_{i,j} = \frac{(Q_i \cdot K_j)}{\sqrt{D}} \text{ or } E = QK^T/\sqrt{D}$$

(D is the dimensionality of the keys)

- Attn. weights: $A = \text{softmax}(E, \text{dim} = 1)$
- Output vectors:

$$Y_i = \sum_j A_{i,j} V_j \text{ or } Y = AV$$

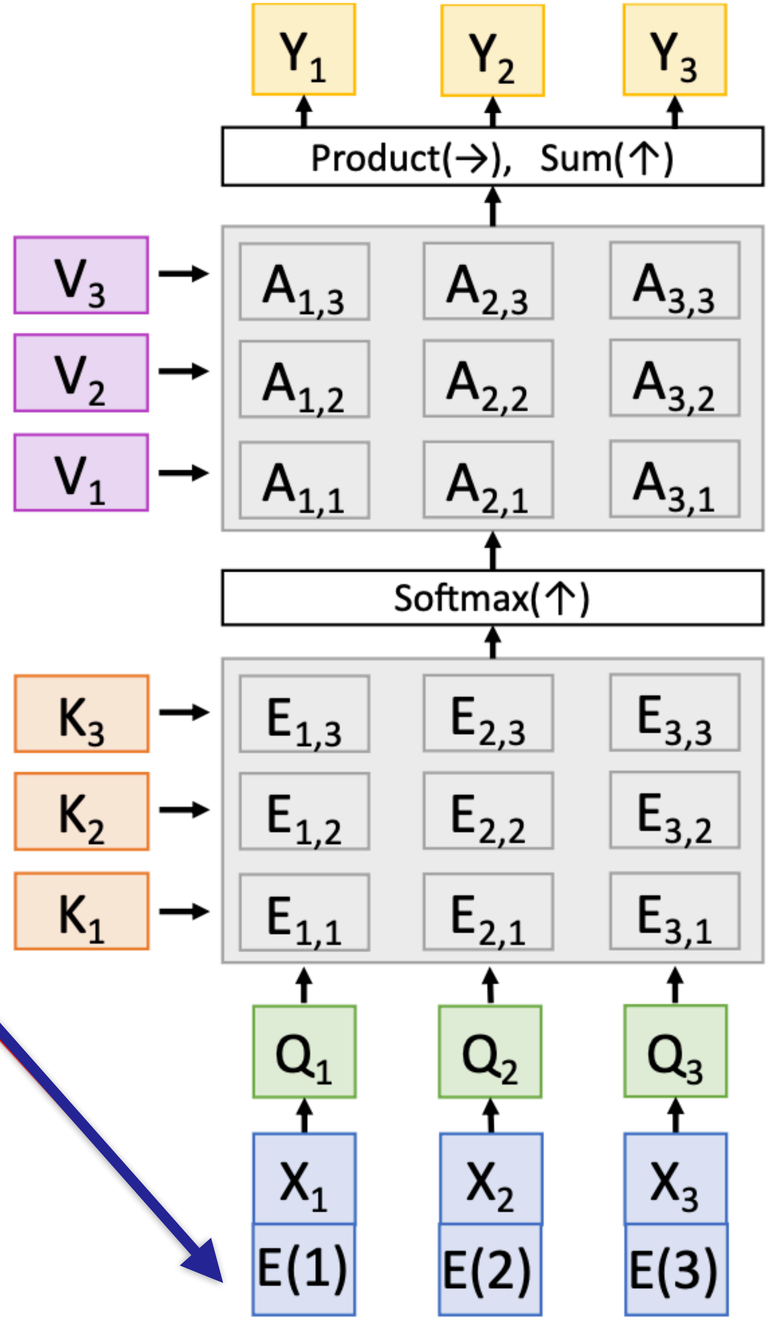


One query per input vector

Adapted from J. Johnson

Positional encoding

- Self attention doesn't "know" the order of the vectors it is processing!
- In order to make processing position-aware, concatenate input with **positional encoding**
- *E* can be learned lookup table, or fixed function

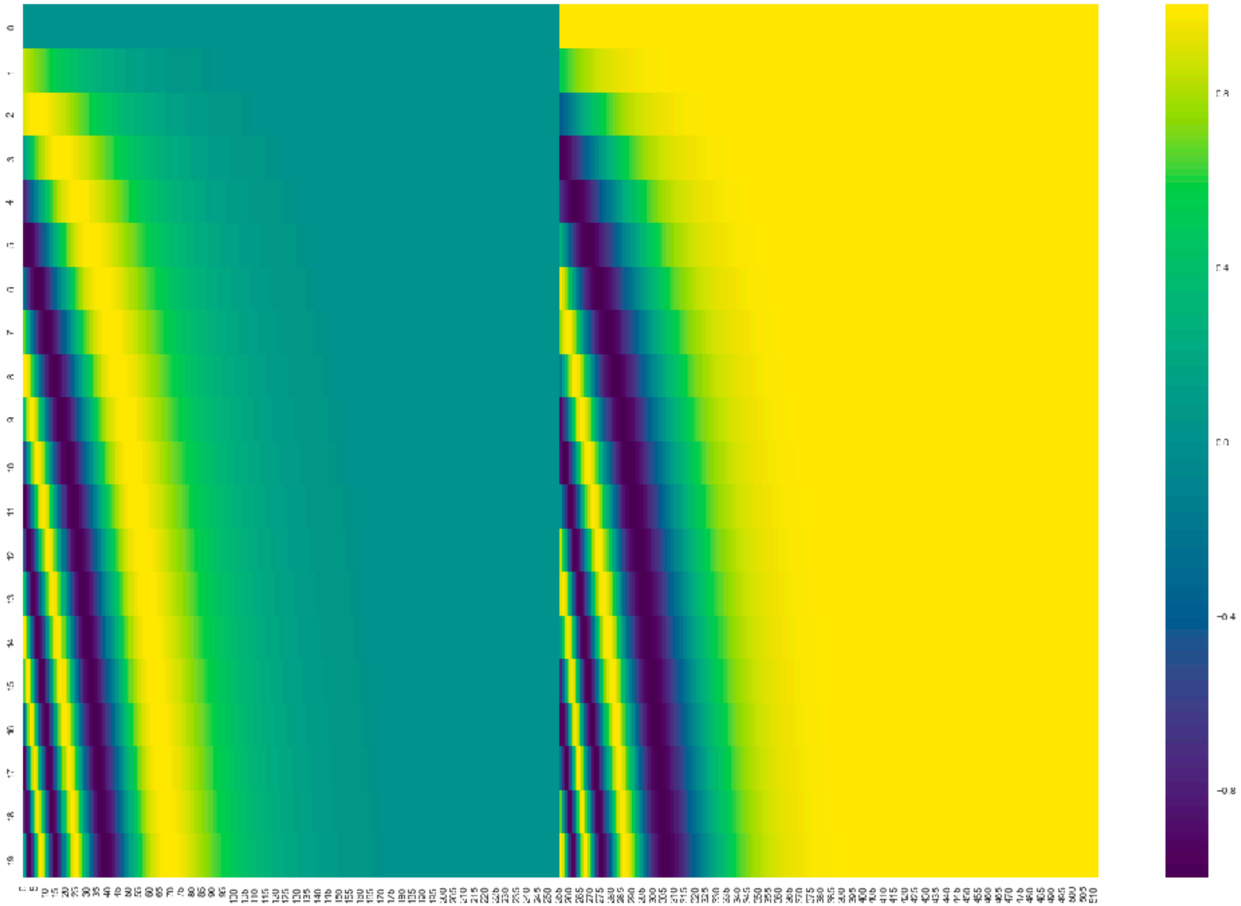


Adapted from J. Johnson

Positional encoding

- To give transformer information about ordering of tokens, add function of position (based on sines and cosines) to every input

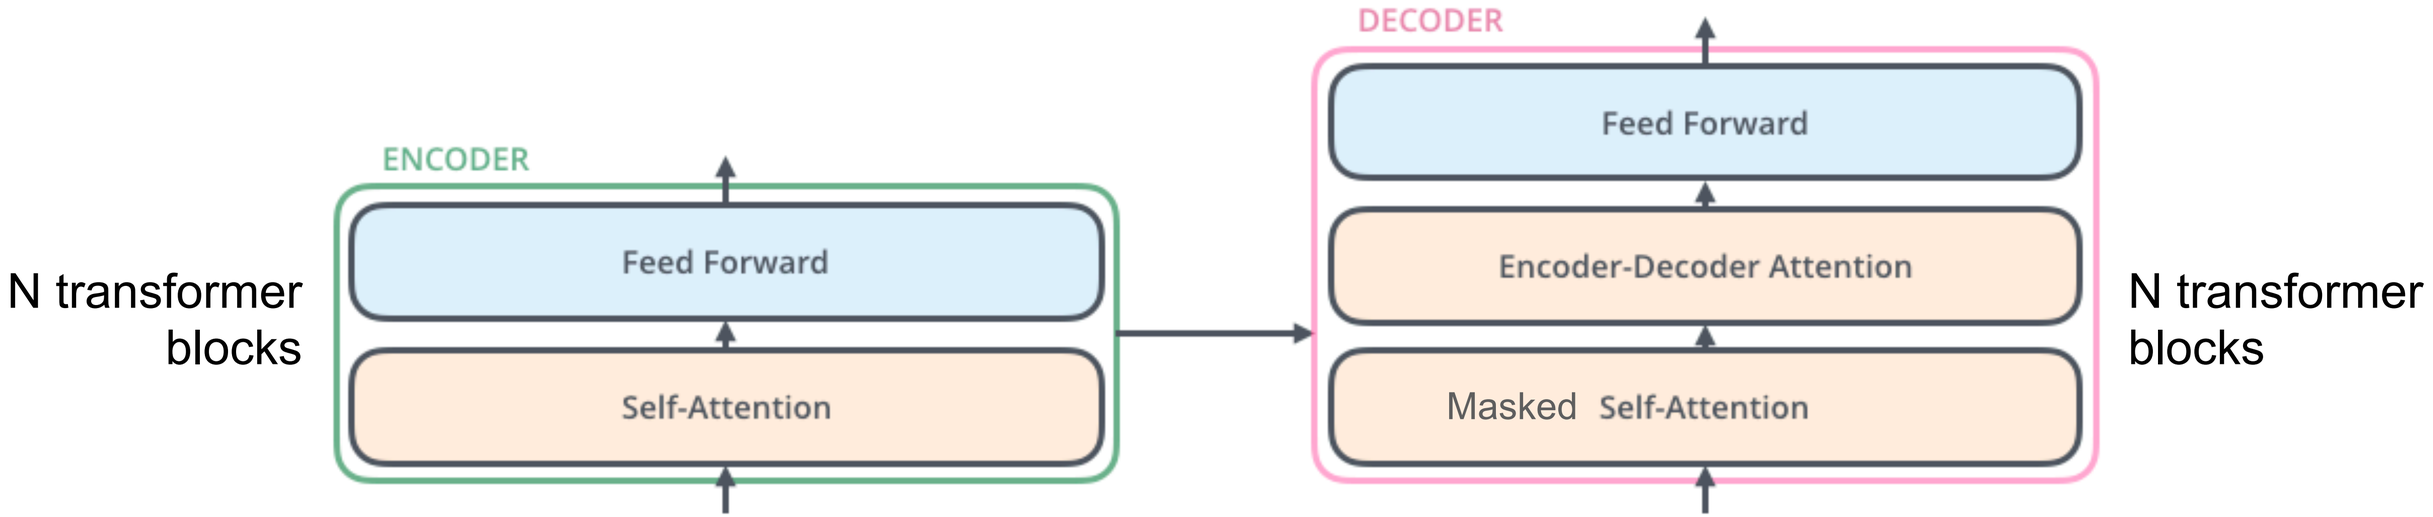
position



Embedding dimension

[Image source]

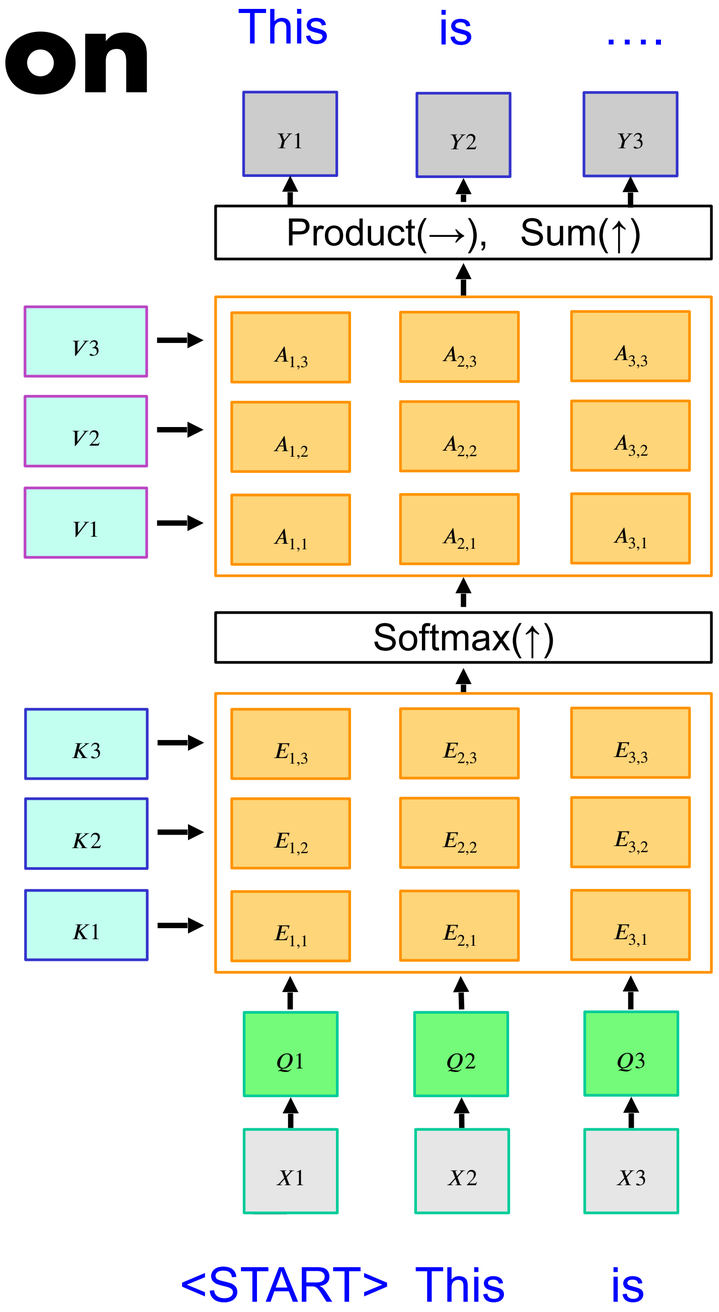
Attention mechanisms: Overview



- **Encoder self-attention:** queries, keys, and values come from previous layer of encoder
- **Decoder self-attention:** values corresponding to future decoder outputs are masked out
- **Encoder-decoder attention:** queries come from previous decoder layer, keys and values come from output of encoder

Decoder: Masked self-attention

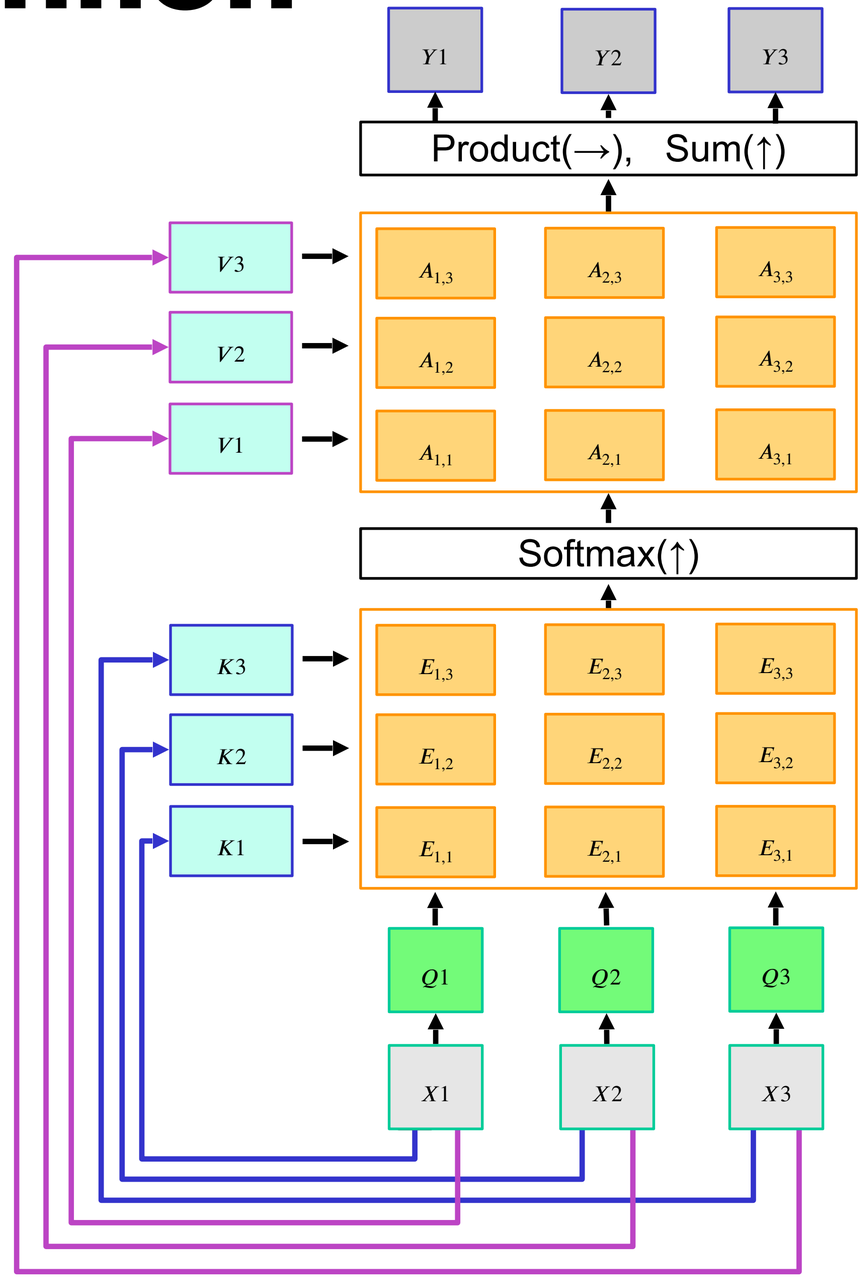
- The decoder should not "look ahead" in the output sequence



Adapted from J. Johnson

Decoder: Masked self-attention

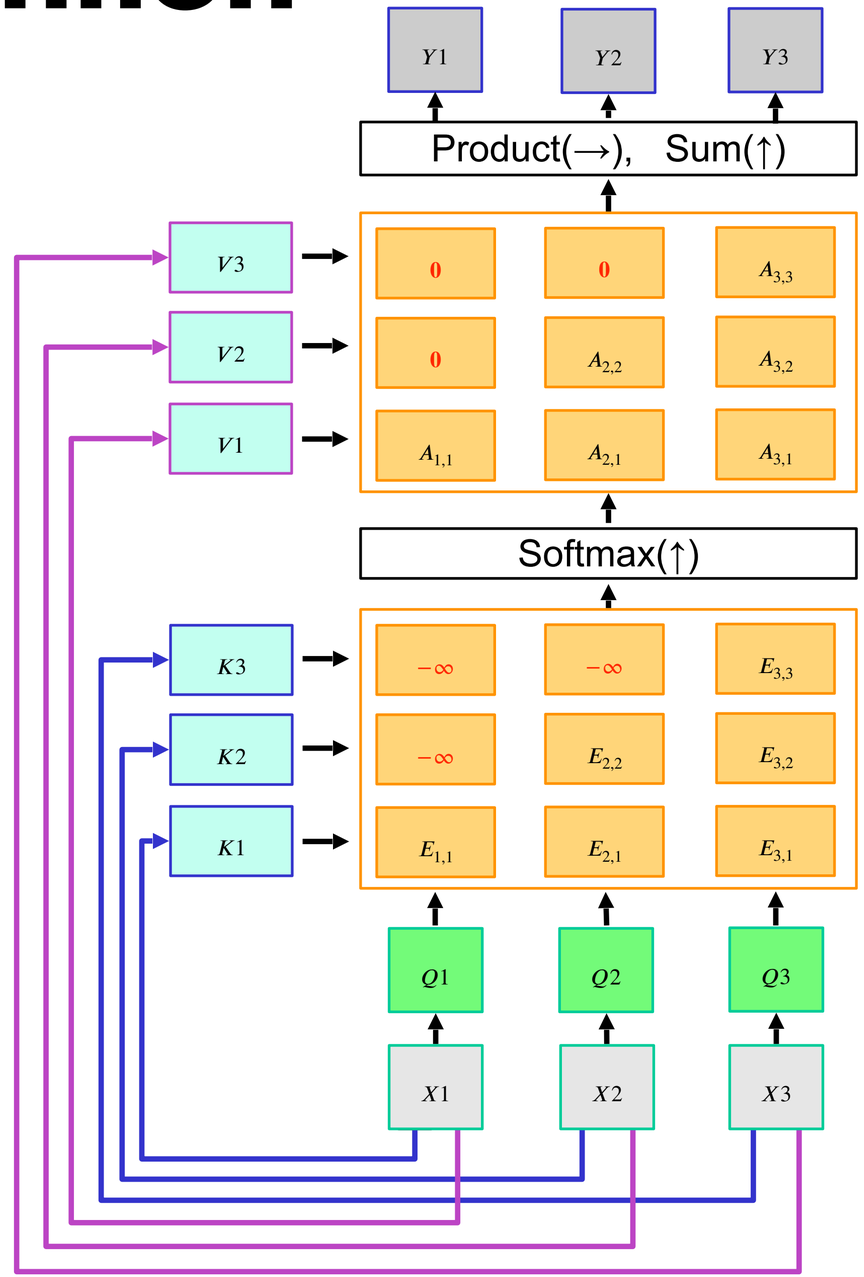
- The decoder should not "look ahead" in the output sequence



Adapted from J. Johnson

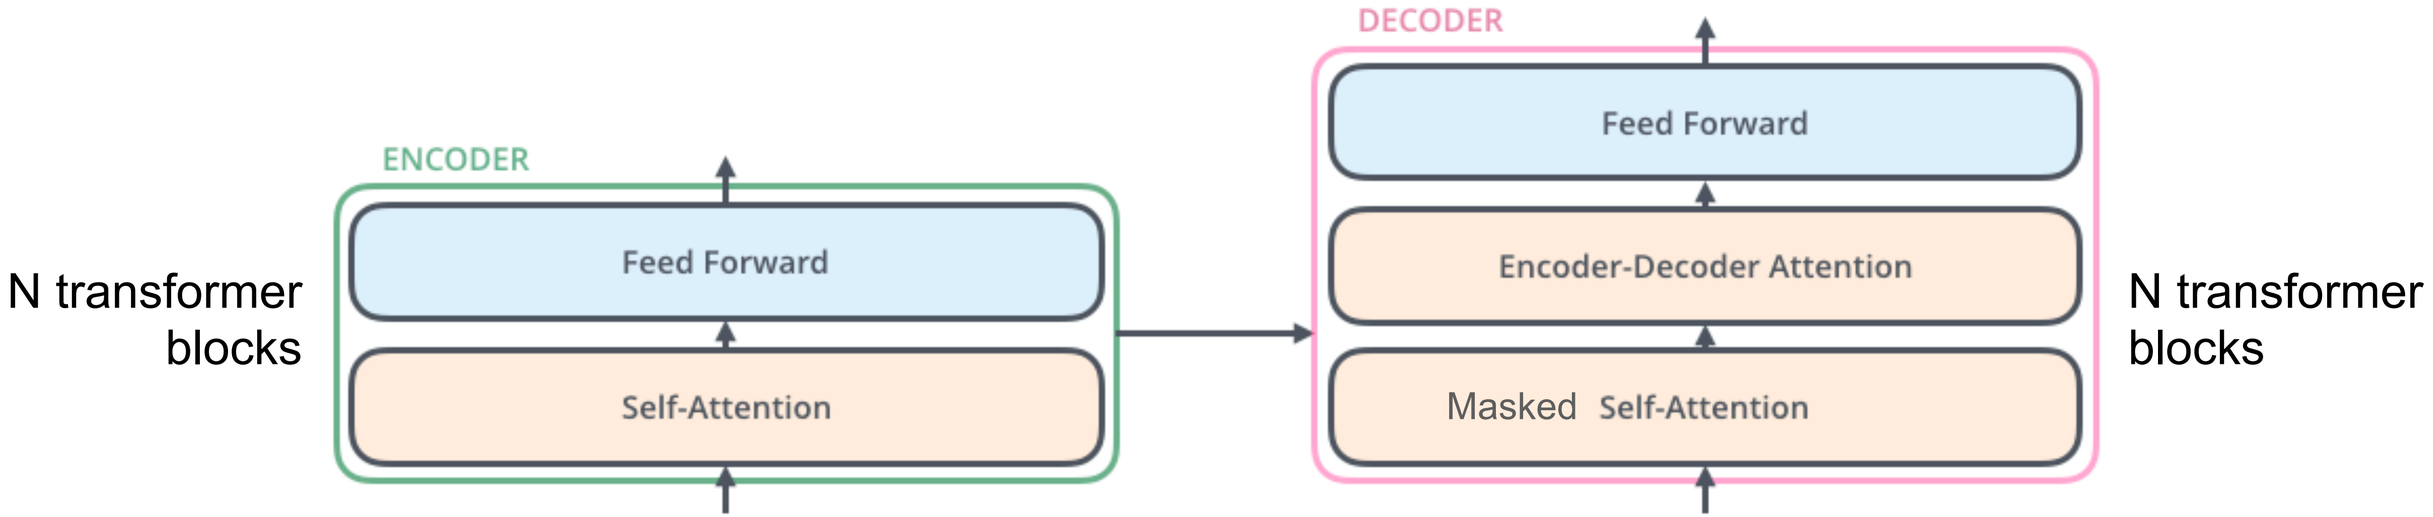
Decoder: Masked self-attention

- The decoder should not "look ahead" in the output sequence



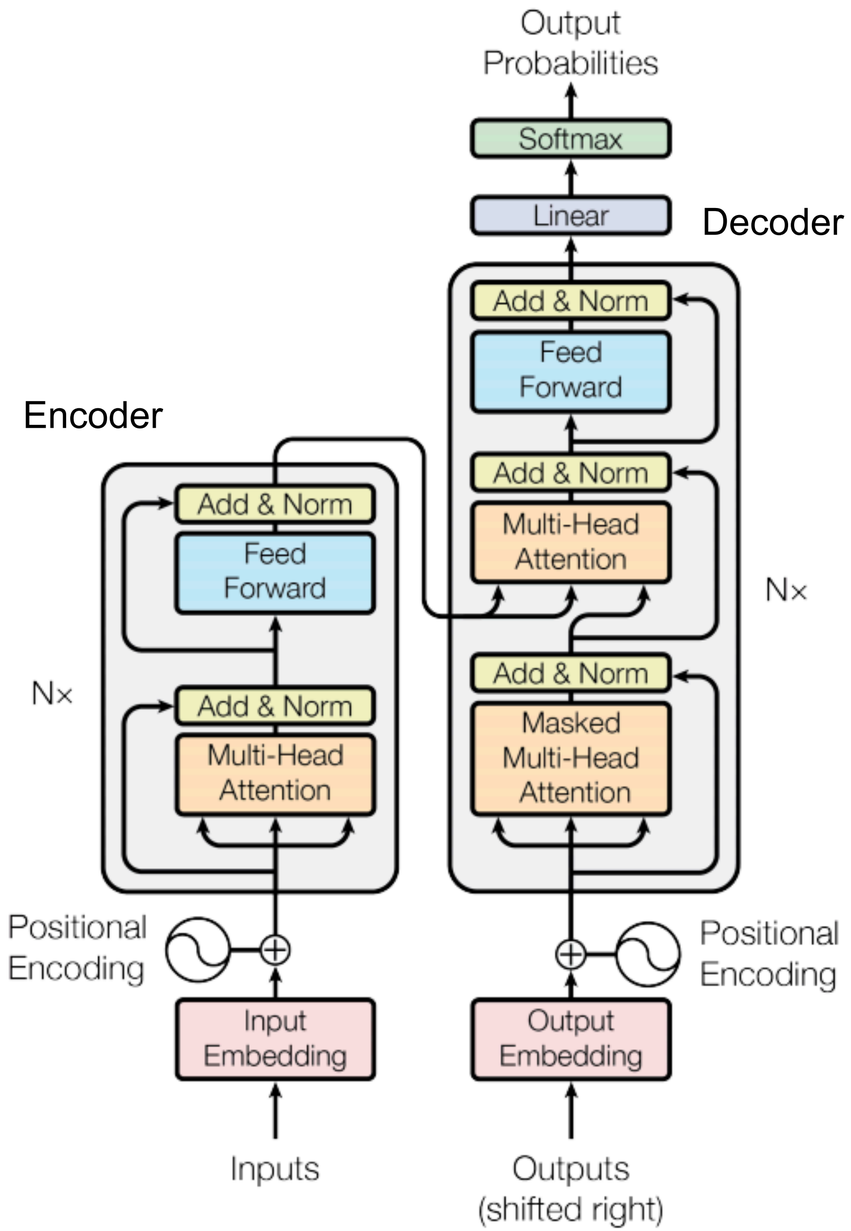
Adapted from J. Johnson

Attention mechanisms: Overview



- **Encoder self-attention:** queries, keys, and values come from previous layer of encoder
- **Decoder self-attention:** values corresponding to future decoder outputs are masked out
- **Encoder-decoder attention:** queries come from previous decoder layer, keys and values come from output of encoder

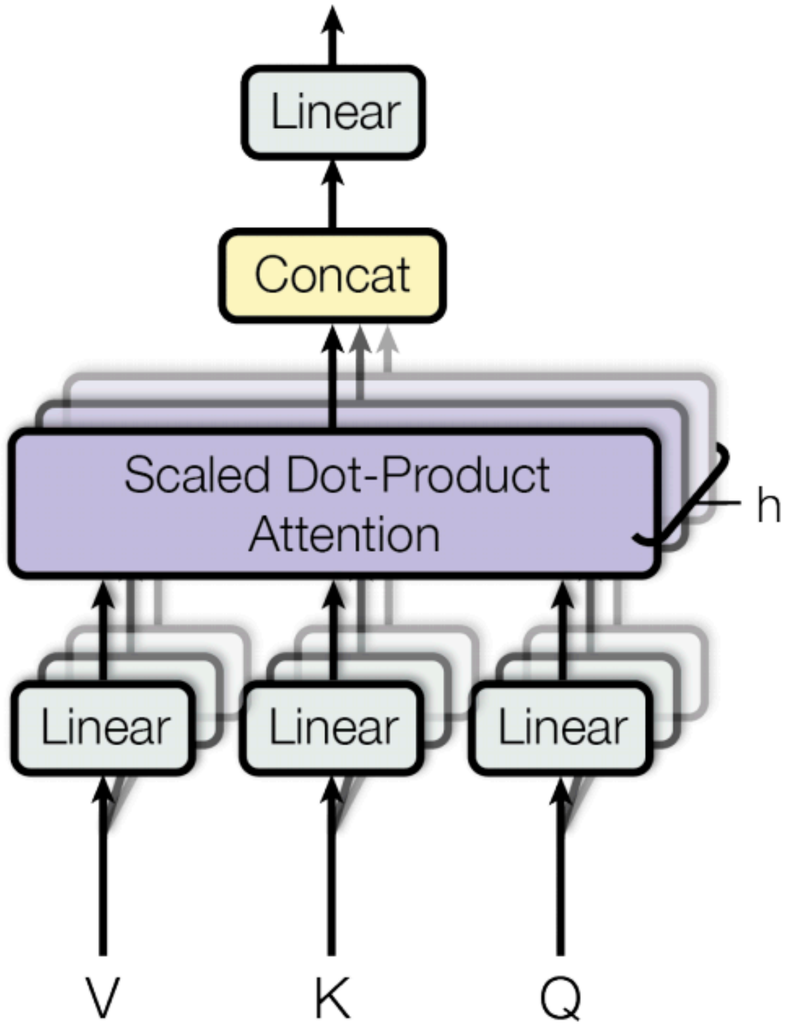
Transformer architecture: Details



A. Vaswani et al., Attention is all you need, NeurIPS 2017

Multi-head attention

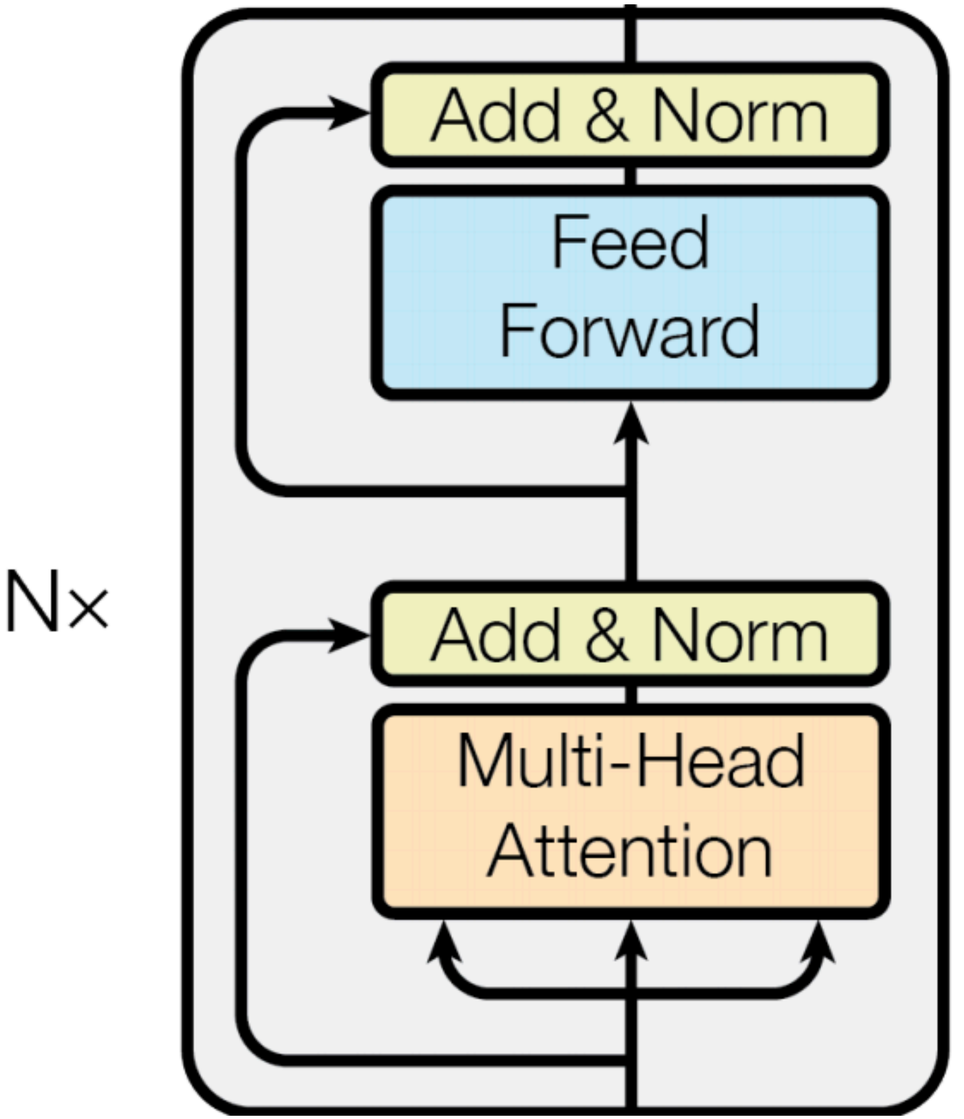
- Run h attention models in parallel on top of different linearly projected versions of Q, K, V; concatenate and linearly project the results
- Intuition: enables model to attend to different kinds of information at different positions (see visualization tool)



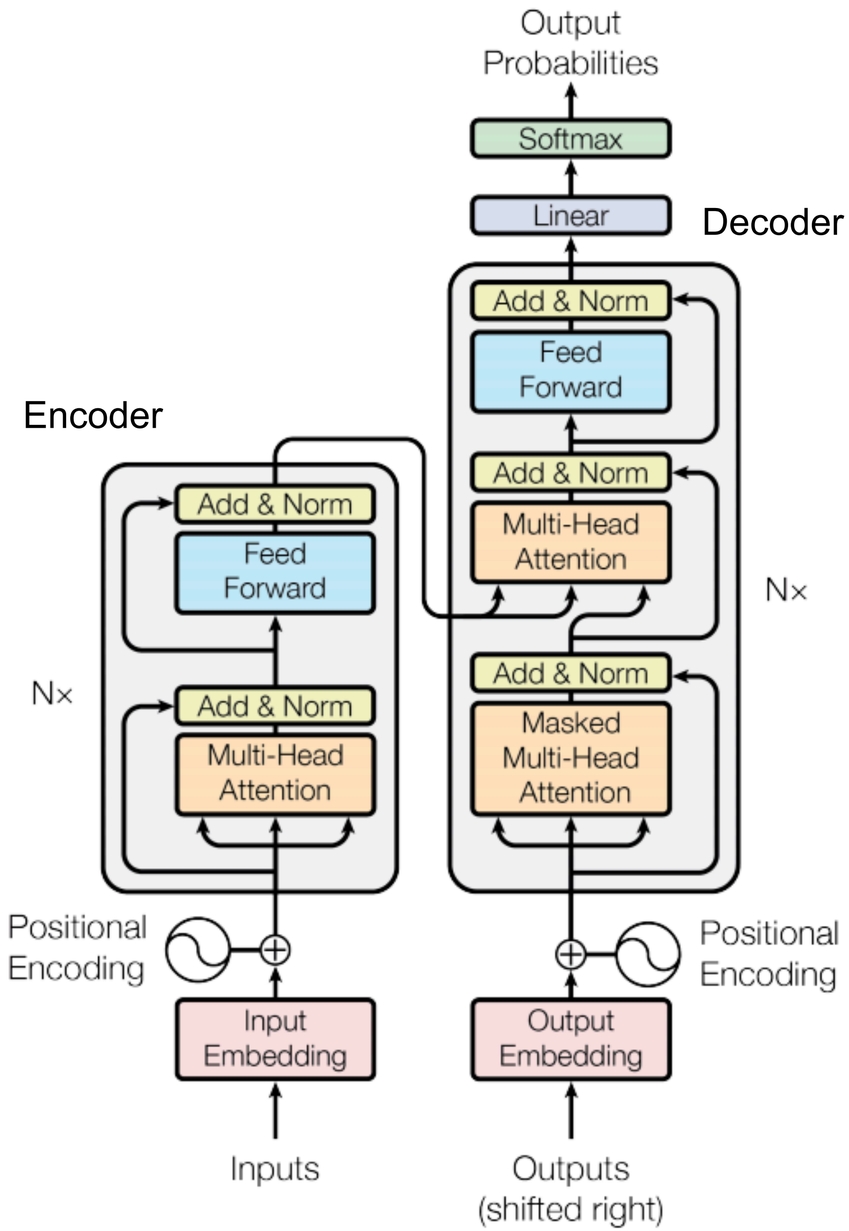
Transformer blocks

- A **Transformer** is a sequence of transformer blocks
  - Vaswani et al.: N=12 blocks, embedding dimension = 512,
    6 attention heads
  - **Add & Norm:** residual connection followed by layer normalization
  - **Feedforward:** two linear layers with ReLUs in between, applied *independently* to each vector

- Attention is the only interaction between inputs!



Transformer architecture: Zooming back out



A. Vaswani et al., Attention is all you need, NeurIPS 2017

Transformer implementation

```python
class MultiHeadedAttention(nn.Module):
    """
    Multi-Head Attention module from "Attention is All You Need"
    Implementation modified from OpenNMT-py.
    https://github.com/OpenNMT/OpenNMT-py
    """

    def __init__(self, num_heads: int, size: int, dropout: float = 0.1):
        """
        Create a multi-headed attention layer.
        :param num_heads: the number of heads
        :param size: model size (must be divisible by num_heads)
        :param dropout: probability of dropping a unit
        """
        super(MultiHeadedAttention, self).__init__()

        assert size % num_heads == 0

        self.head_size = head_size = size // num_heads
        self.model_size = size
        self.num_heads = num_heads

        self.k_layer = nn.Linear(size, num_heads * head_size)
        self.v_layer = nn.Linear(size, num_heads * head_size)
        self.q_layer = nn.Linear(size, num_heads * head_size)

        self.output_layer = nn.Linear(size, size)
        self.softmax = nn.Softmax(dim=-1)
        self.dropout = nn.Dropout(dropout)
```

nn.Linear:
Learnable params

Transformer implementation

```
def forward(
    self, k: Tensor, v: Tensor, q: Tensor, rel_mouth_times=None, mask: Tensor = None
):
    """
    Computes multi-headed attention.
    :param k: keys   [B, K, D] with K being the sentence length.
    :param v: values [B, K, D]
    :param q: query  [B, Q, D] with Q being the sentence length.
    :param mask: optional mask [B, 1, K]
    :return:
    """
    batch_size = k.size(0)  # B
    num_heads = self.num_heads  # H
    # project the queries (q), keys (k), and values (v)
    k = self.k_layer(k)
    v = self.v_layer(v)
    q = self.q_layer(q)

    # reshape q, k, v for our computation to [B, H, ..., D/H]
    k = k.view(batch_size, -1, num_heads, self.head_size).transpose(1, 2)
    v = v.view(batch_size, -1, num_heads, self.head_size).transpose(1, 2)
    q = q.view(batch_size, -1, num_heads, self.head_size).transpose(1, 2)

    # compute scores
    q = q / math.sqrt(self.head_size)
```

$$K = XW_K$$
$$V = XW_V$$
$$Q = XW_Q$$

Transformer implementation

```
# [B, H, Q, K]

        o = self.feed_forward(h)
        return o
```

1. Beyond CNNs

- **Attention & Transformer**
- **Vision Transformers**

Image transformer – Google

Self-attention only locally

- Image generation and super-resolution with 32x32 output, attention restricted to local neighborhoods

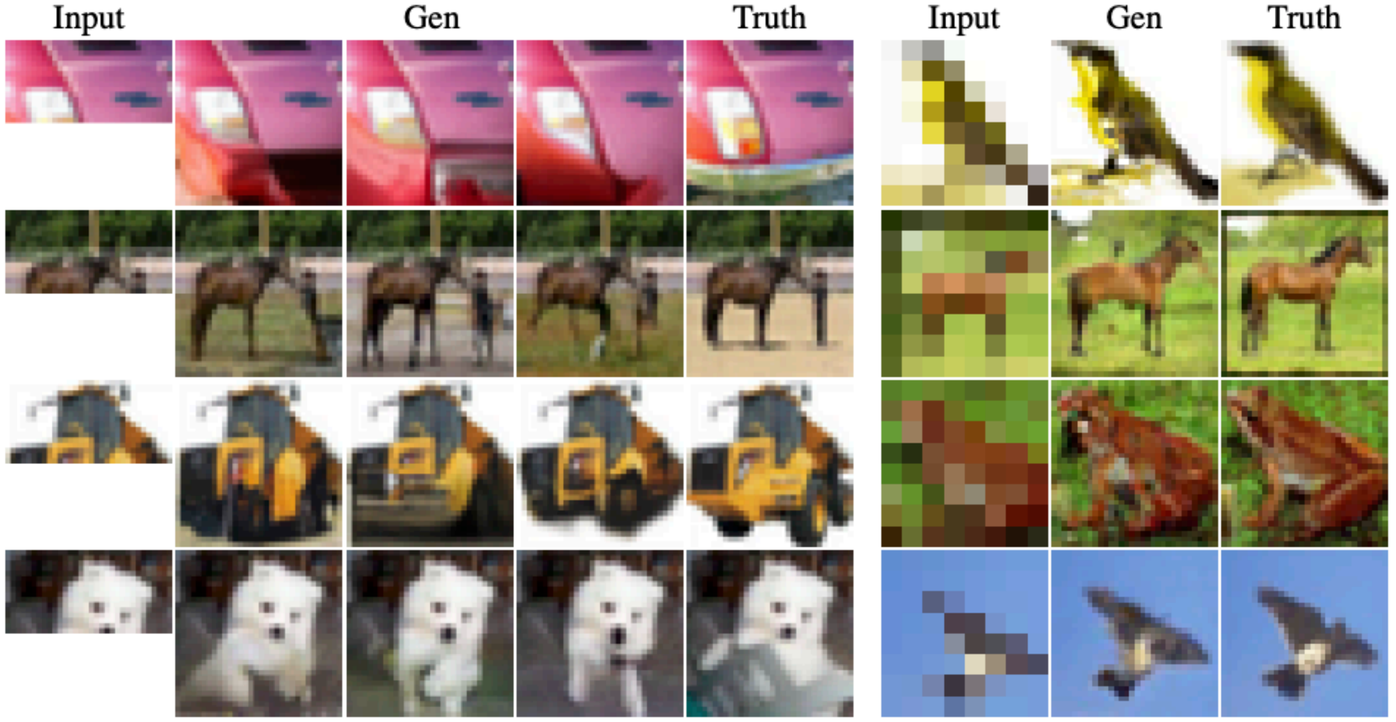

Table 2. On the left are image completions from our best conditional generation model, where we sample the second half. On the right are samples from our four-fold super-resolution model trained on CIFAR-10. Our images look realistic and plausible, show good diversity among the completion samples and observe the outputs carry surprising details for coarse inputs in super-resolution.

N. Parmar et al., Image transformer, ICML 2018

Sparse transformers – OpenAI

scalable approximations to global self-attention in order to be applicable to images

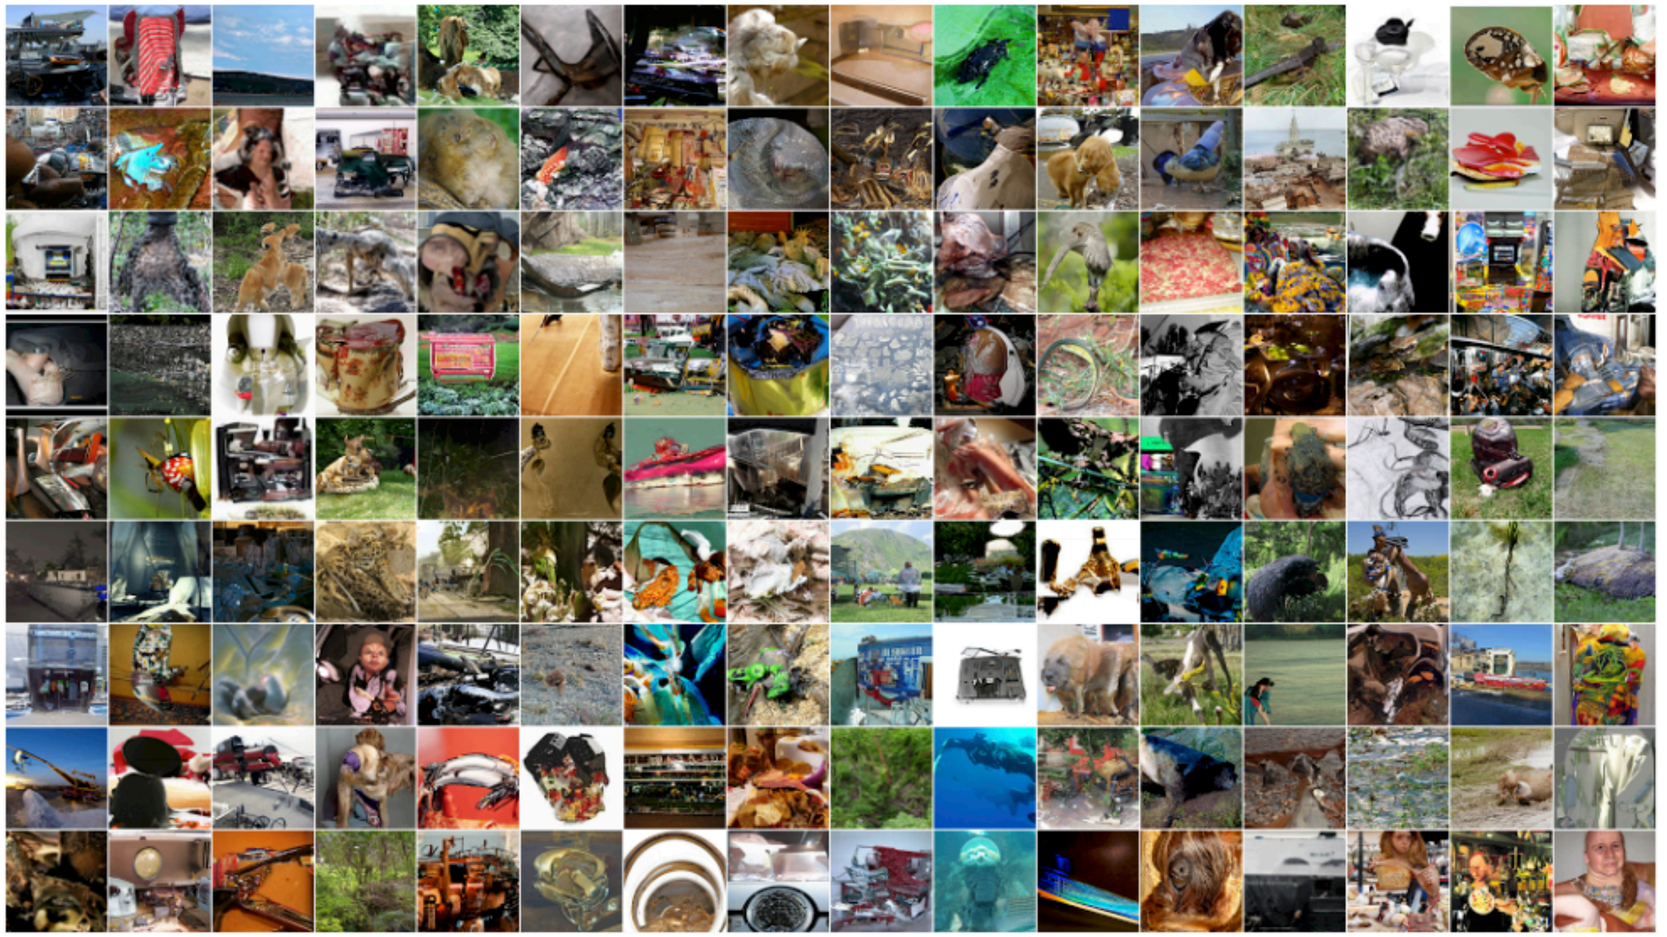

Figure 5. Unconditional samples from ImageNet 64x64, generated with an unmodified softmax temperature of 1.0. We are able to learn long-range dependencies directly from pixels without using a multi-scale architecture.

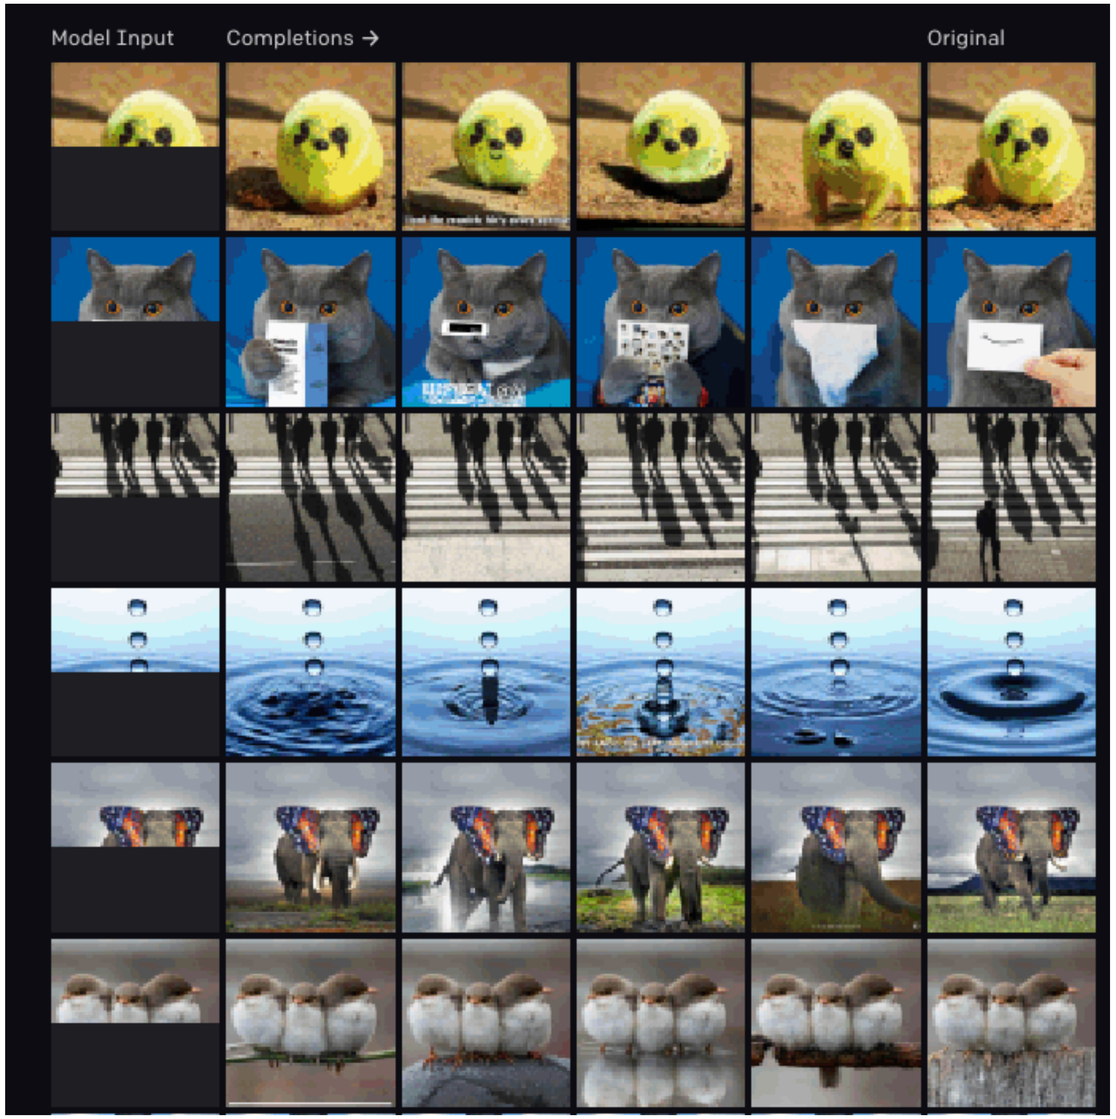
R. Child et al., Generating Long Sequences with Sparse Transformers, arXiv 2019

Image GPT* – OpenAI

works on reduced resolutions



https://openai.com/blog/image-gpt/

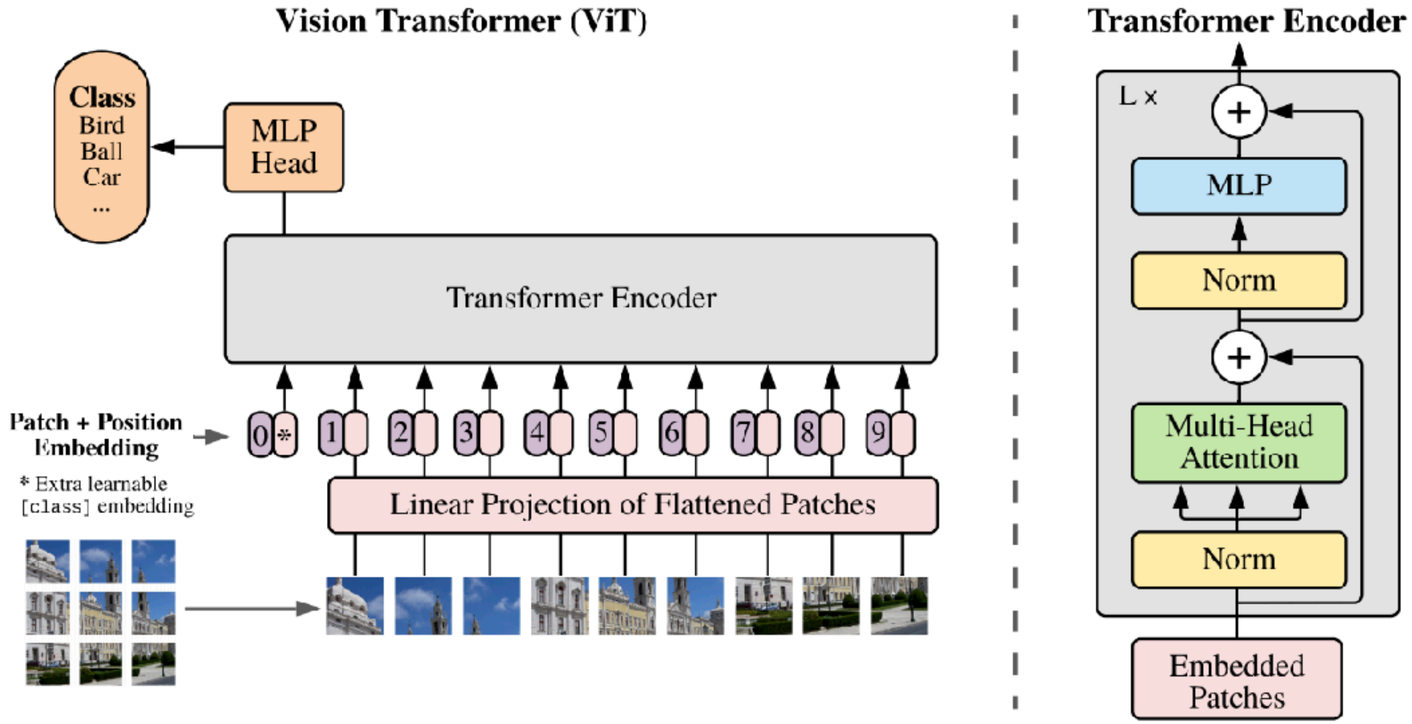
M. Chen et al., Generative pretraining from pixels, ICML 2020

*GPT: Generative pre-trained Transformer

Vision transformer (ViT) - Google

Full resolution

- Split an image into patches, feed linearly projected patches into standard transformer encoder
  - With patches of 14x14 pixels, you need 16x16=256 patches to represent 224x224 images



A. Dosovitskiy et al. An image is worth 16x16 words: Transformers for image recognition at scale. ICLR 2021

Vision transformer (ViT)

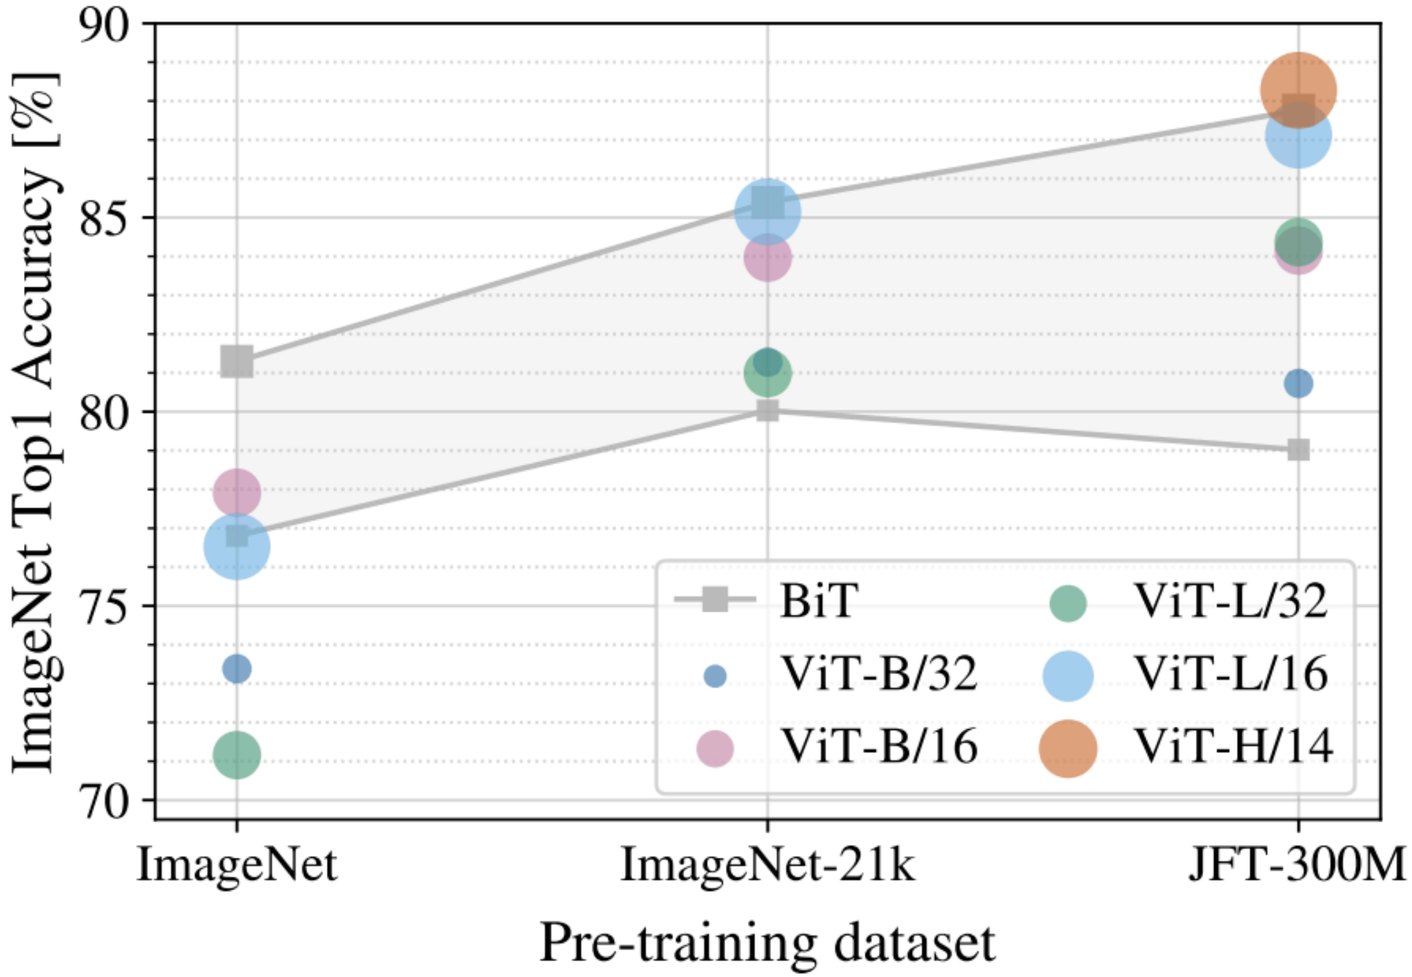


Figure 3: Transfer to ImageNet. While large ViT models perform worse than BiT ResNets (shaded area) when pre-trained on small datasets, they shine when pre-trained on larger datasets. Similarly, larger ViT variants overtake smaller ones as the dataset grows.

BiT: Big Transfer (ResNet)
ViT: Vision Transformer (Base/Large/Huge, **patch size of 14x14, 16x16, or 32x32)**

Internal Google dataset (not public)

A. Dosovitskiy et al. An image is worth 16x16 words: Transformers for image recognition at scale. ICLR 2021

Masked autoencoders are scalable vision learners

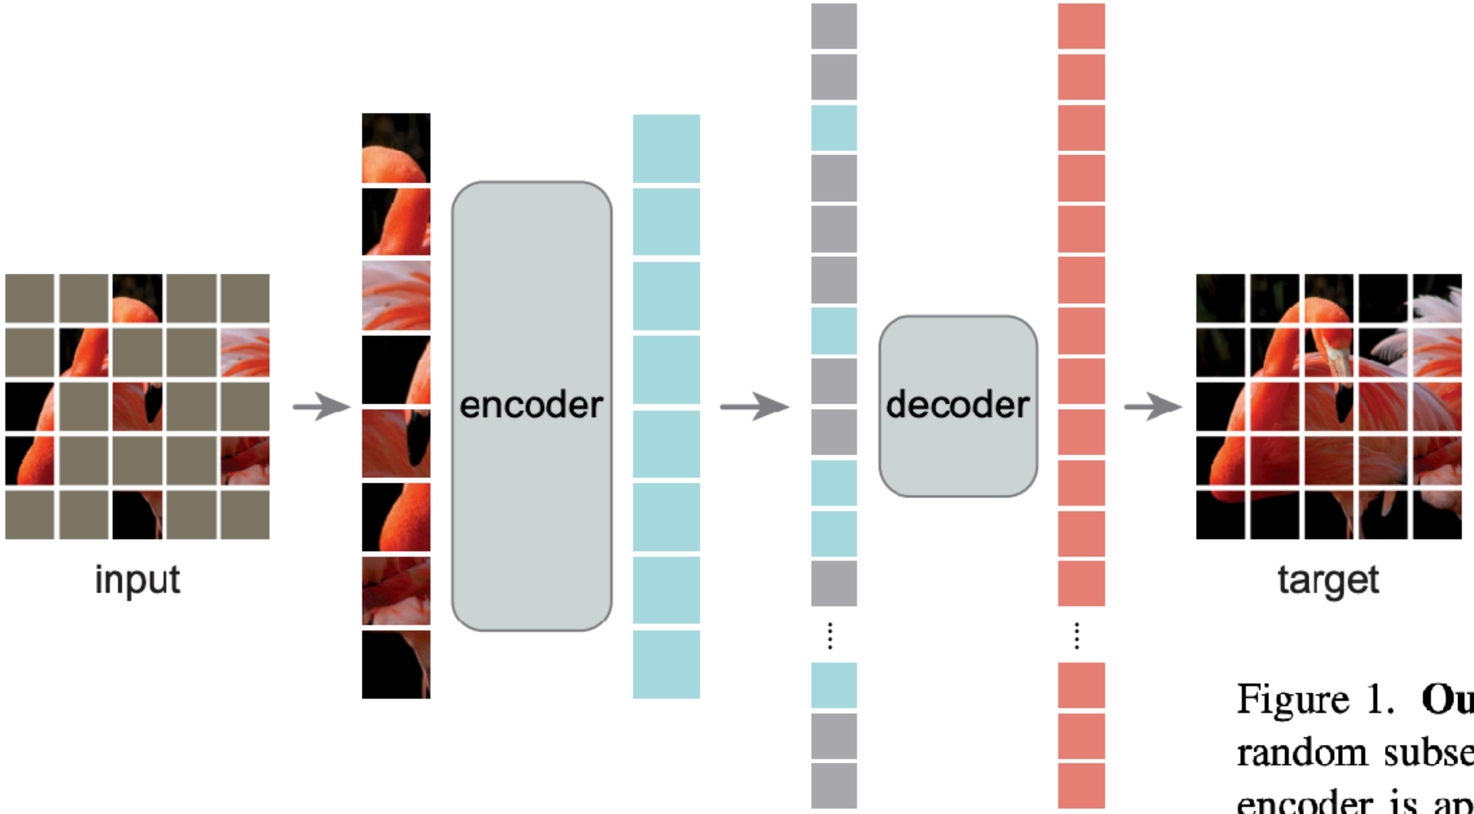

Figure 1. **Our MAE architecture**. During pre-training, a large random subset of image patches (*e.g.*, 75%) is masked out. The encoder is applied to the small subset of *visible patches*. Mask tokens are introduced *after* the encoder, and the full set of encoded patches and mask tokens is processed by a small decoder that reconstructs the original image in pixels. After pre-training, the decoder is discarded and the encoder is applied to uncorrupted images to produce representations for recognition tasks.

K. He et al. Masked autoencoders are scalable vision learners. arXiv 2021

Masked autoencoders are scalable vision learners

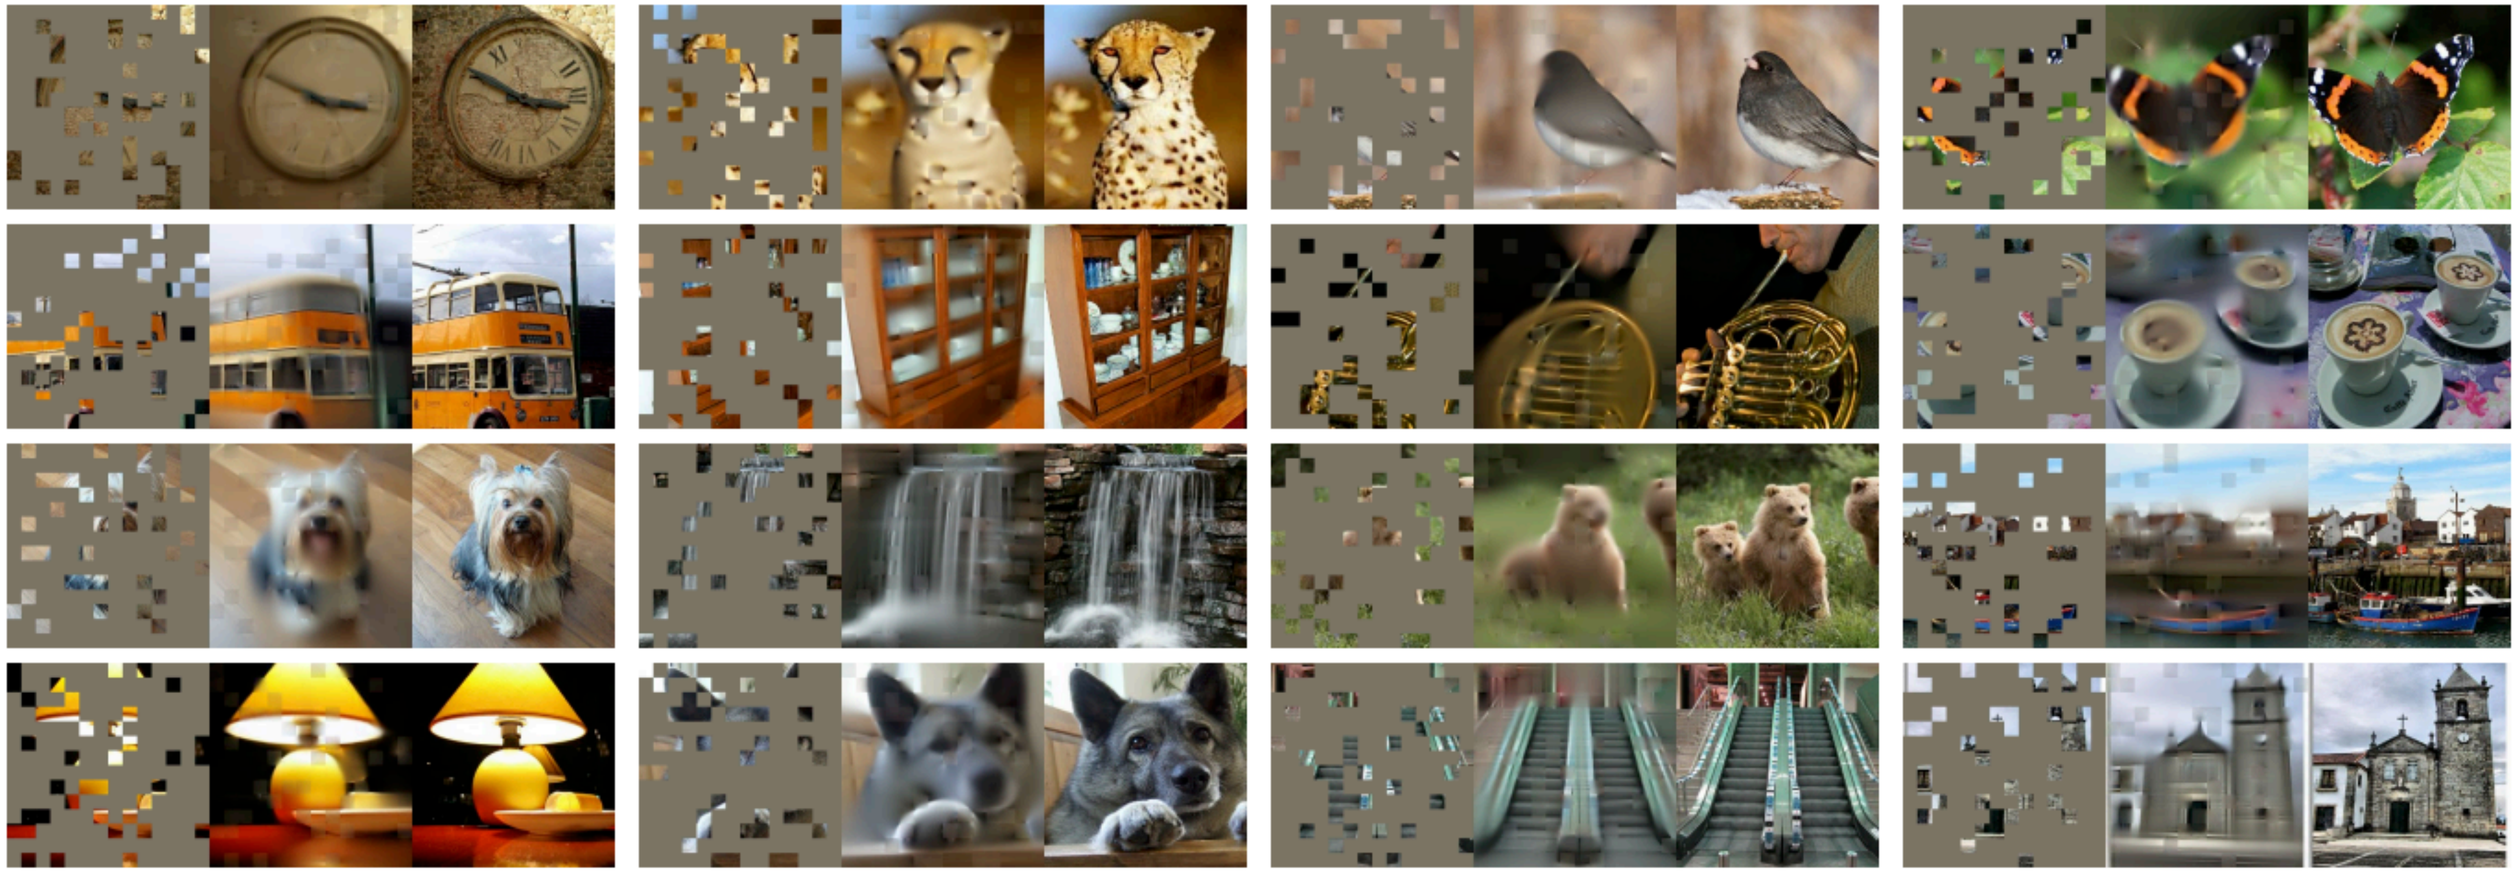

Figure 2. Example results on ImageNet *validation* images. For each triplet, we show the masked image (left), our MAE reconstruction† (middle), and the ground-truth (right). The masking ratio is 80%, leaving only 39 out of 196 patches. More examples are in the appendix.

†*As no loss is computed on visible patches, the model output on visible patches is qualitatively worse. One can simply overlay the output with the visible patches to improve visual quality. We intentionally opt not to do this, so we can more comprehensively demonstrate the method's behavior.*

K. He et al. Masked autoencoders are scalable vision learners. arXiv 2021

Detection Transformer (DETR)

- Hybrid of CNN and transformer, aimed at standard recognition task

Summary: Beyond CNNs

- CNNs (convolution), Transformers (attention), MLPs (fully connected)
- There is no answer to which architecture is better.
- Often depends on the data.
- If you have infinite data, more complex can be better (e.g., MLP ~ Transformers > CNN).
- Similar performance can be obtained with more efficient models (e.g., MLP ~ Transformers)
- It is possible there will be newer/better architectures/ hypes before you graduate. Stay tuned.

Summary: Beyond CNNs

- Some Advantages of Transformers:
  - Flexibility to handle variable input sequences
  - Flexibility to combine multimodal data

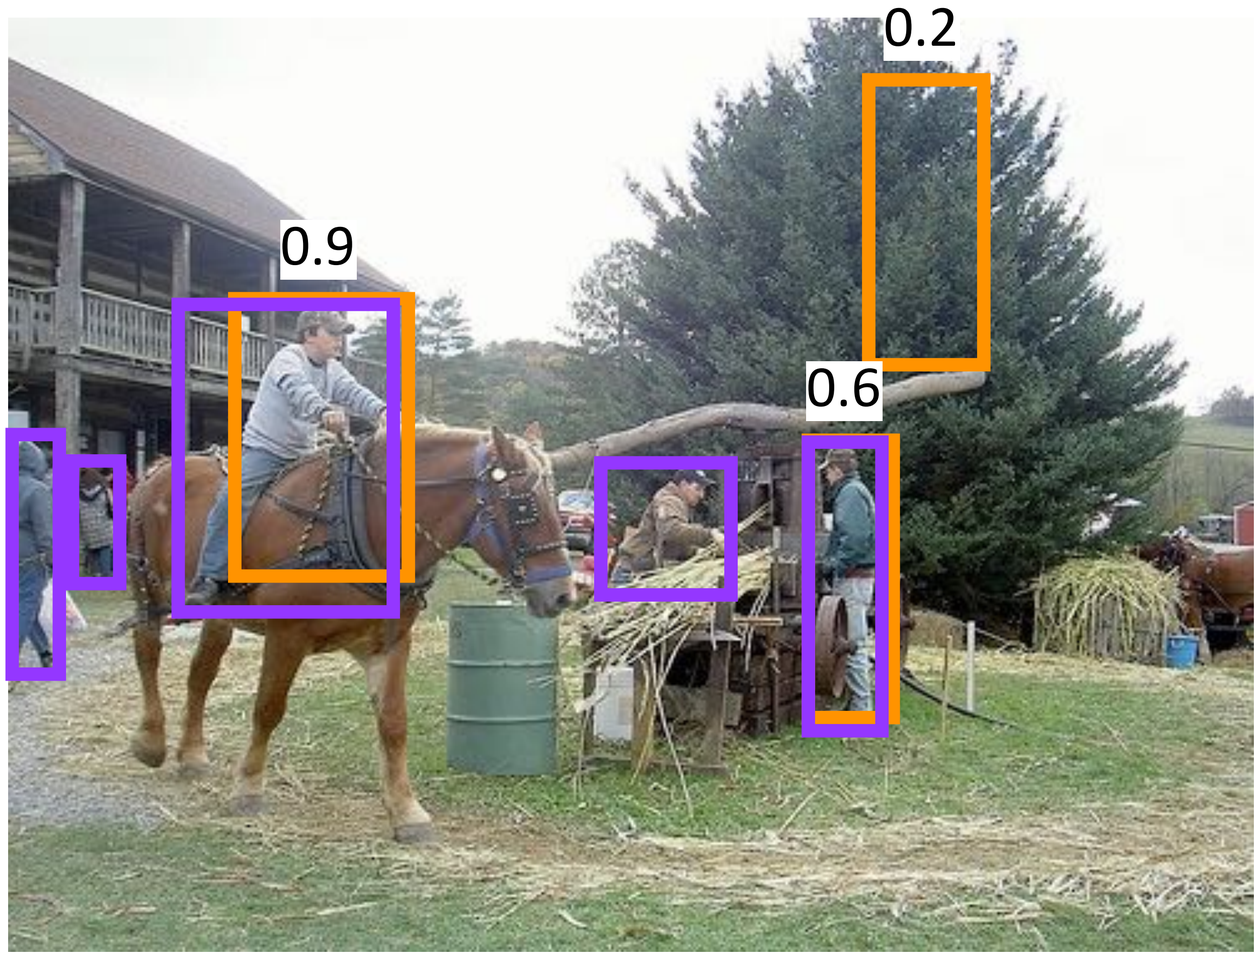
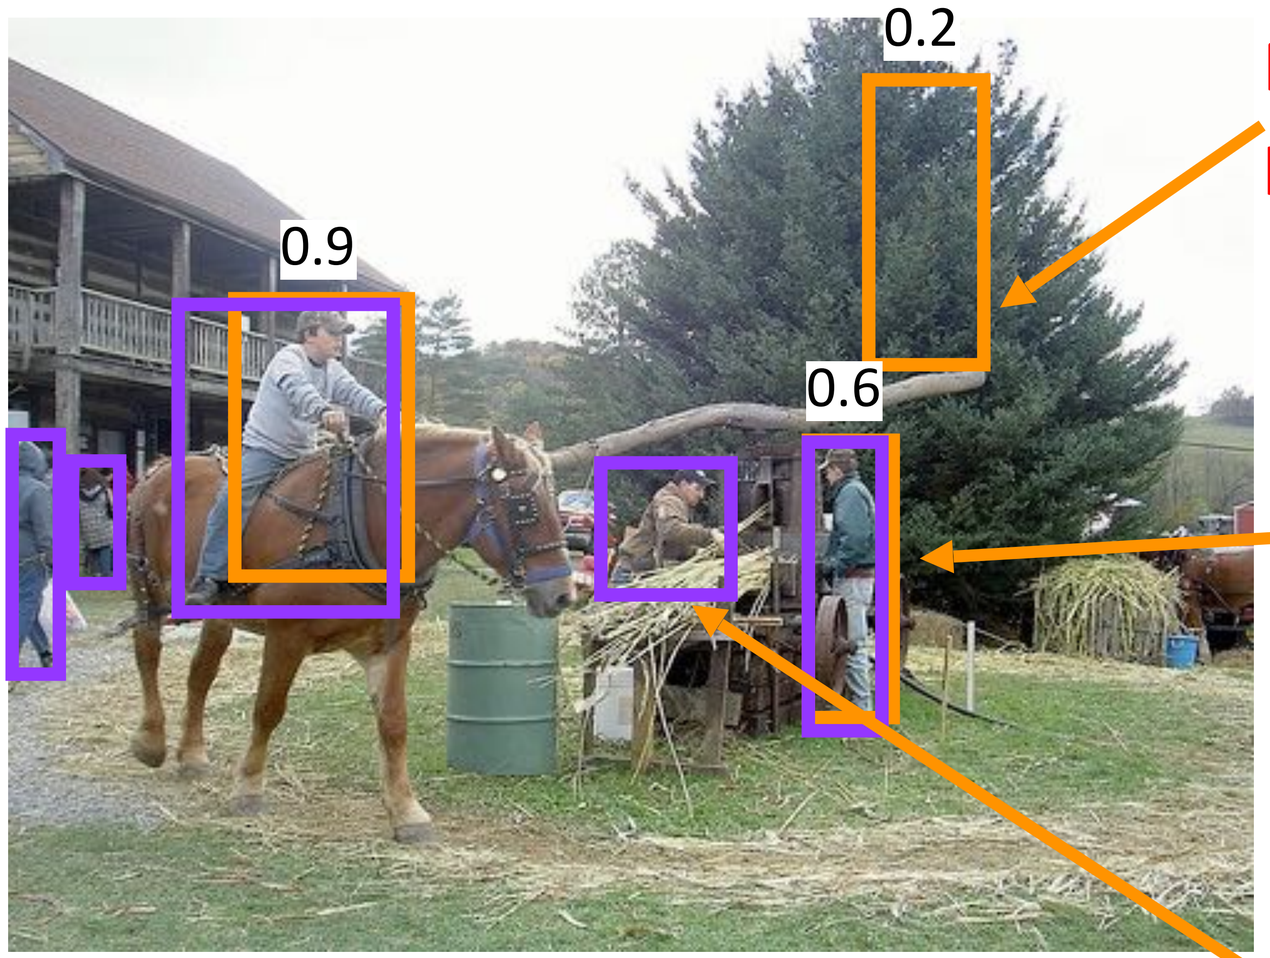
Compare to ground truth



‘person’ detector predictions

ground truth ‘person’ boxes

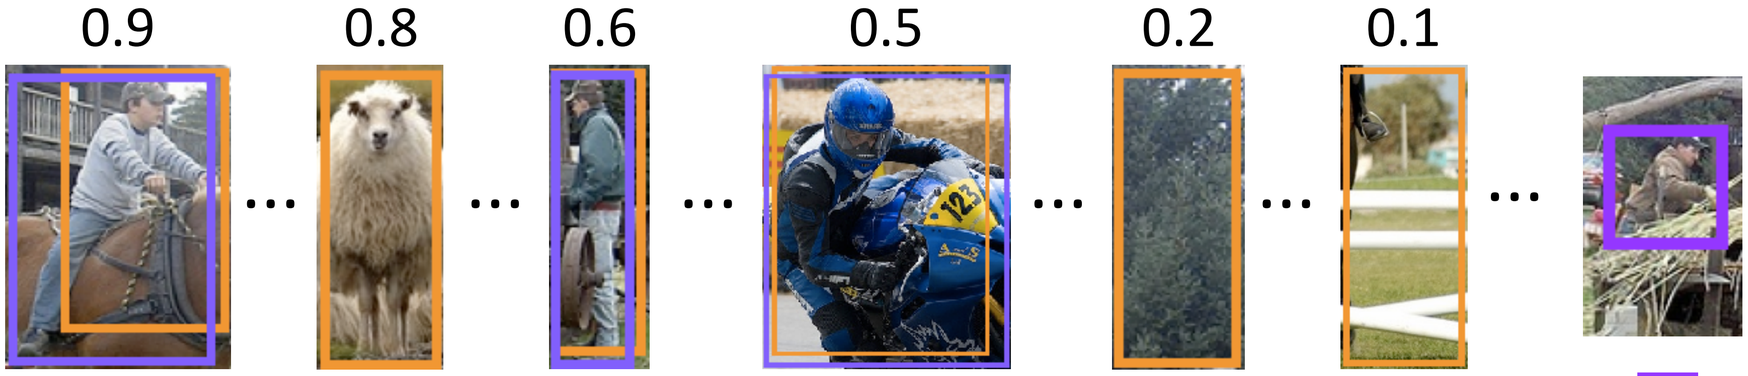
Compare to ground truth



‘person’ detector predictions

ground truth ‘person’ boxes

Sort by confidence

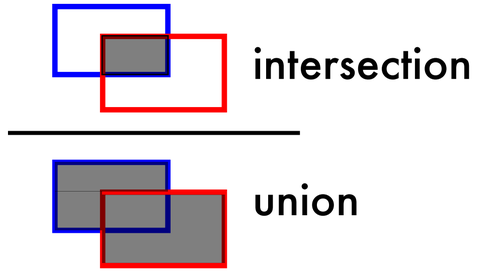


true positive
(high overlap)
i.e., IOU > threshold

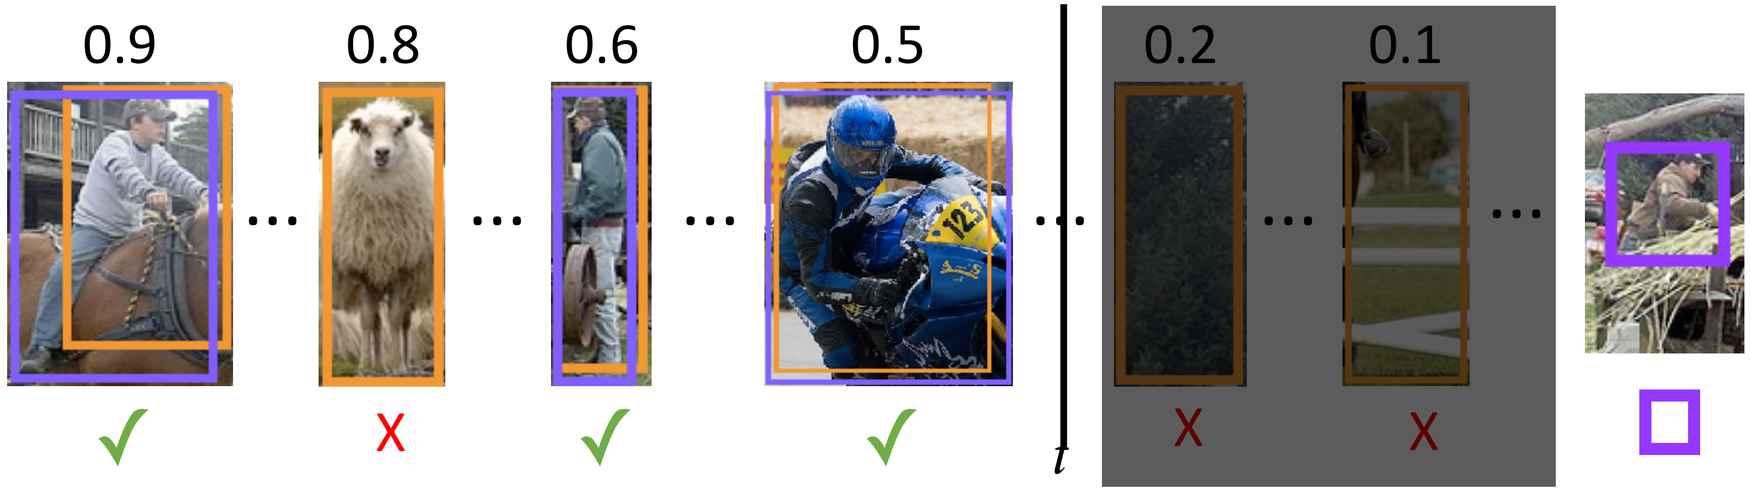
false positive
(no overlap, low overlap, or duplicate)

false negative
(missing detection)

IOU (intersection over union):



Sort by confidence



$$precision@t = \frac{\#true\ positives@t}{\#true\ positives@t + \#false\ positives@t}$$

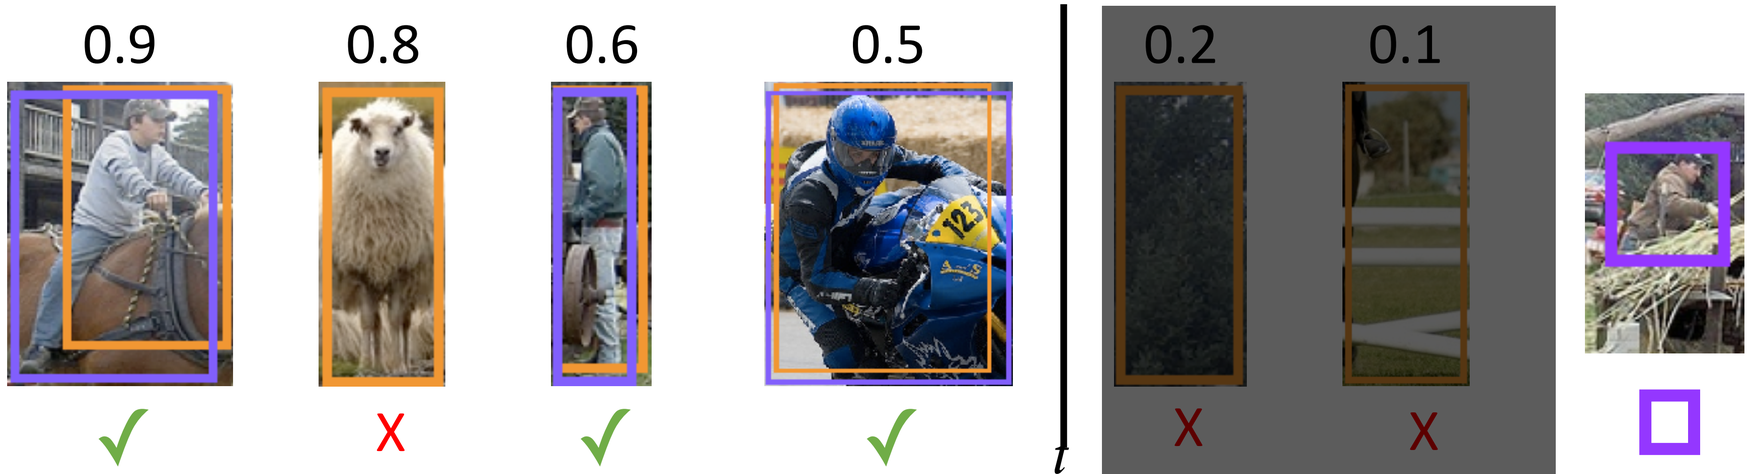
$$recall@t = \frac{\#true\ positives@t}{\#ground\ truth\ objects}$$

$$\frac{\checkmark}{\checkmark + X}$$

$$\frac{\checkmark}{\square}$$

?

Sort by confidence



$t = 0.5$

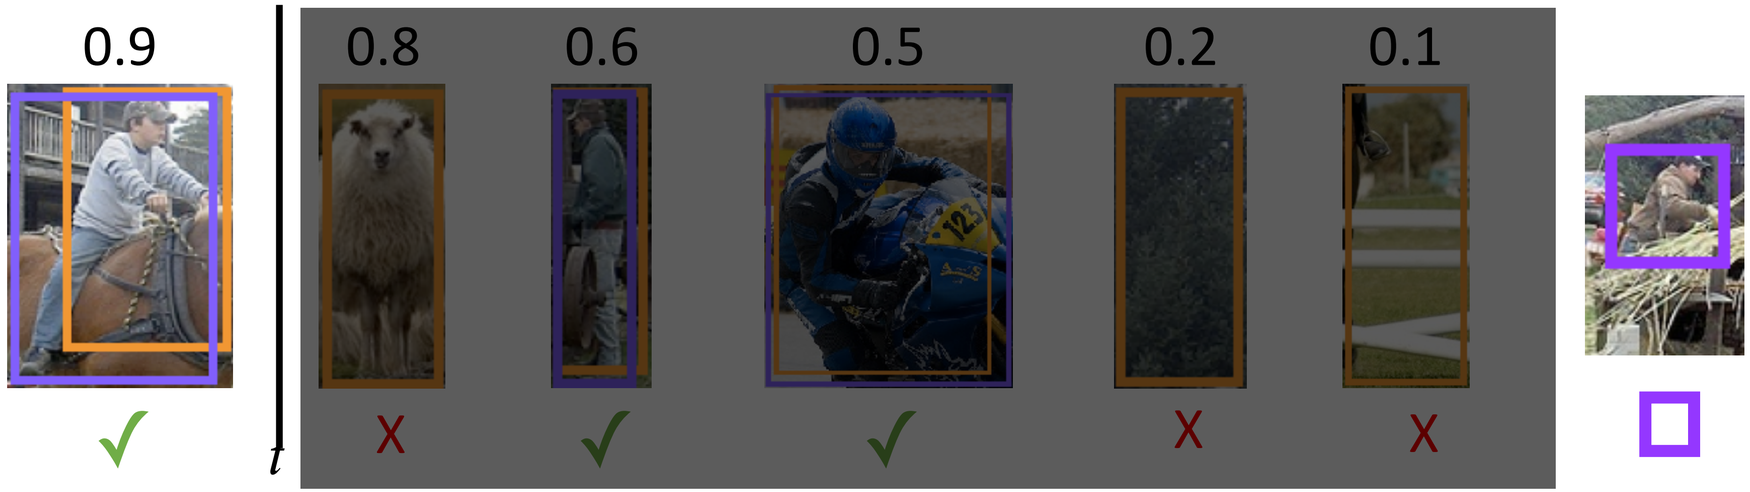
$$precision@t = \frac{\#true\ positives@t}{\#true\ positives@t + \#false\ positives@t}$$

$$\frac{✓}{✓ + X} = 75\%$$

$$recall@t = \frac{\#true\ positives@t}{\#ground\ truth\ objects}$$

$$\frac{✓}{□} = 75\%$$

Sort by confidence



$t = 0.9$

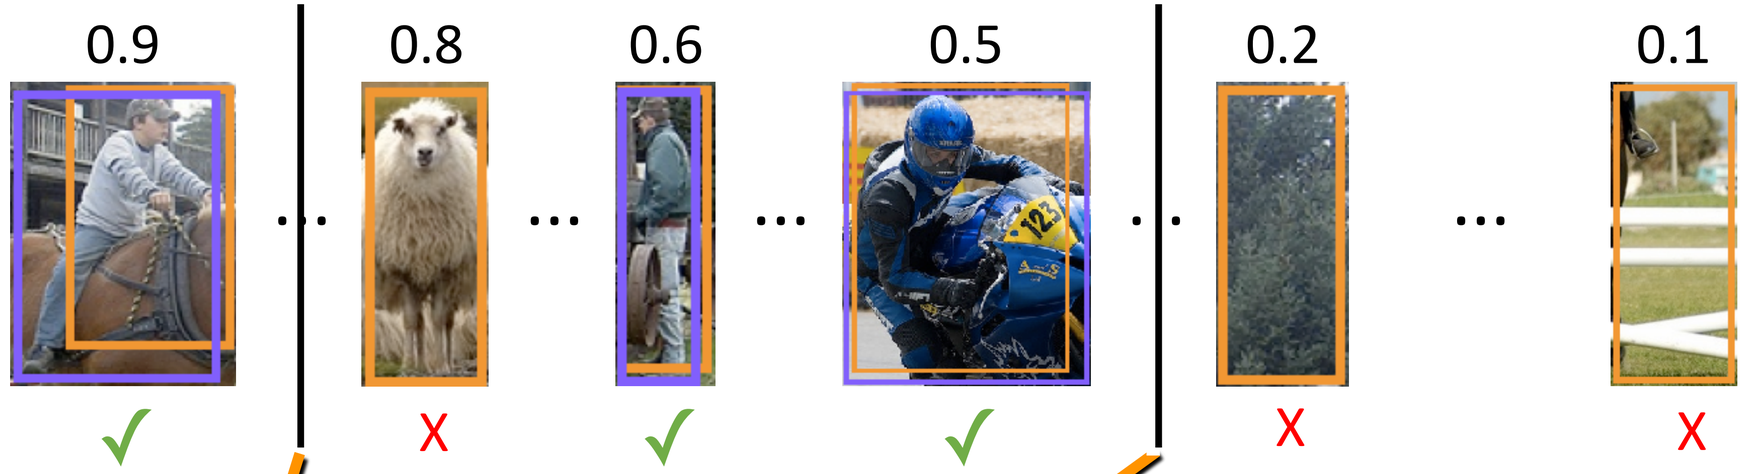
$$precision@t = \frac{\#true\ positives@t}{\#true\ positives@t + \#false\ positives@t}$$

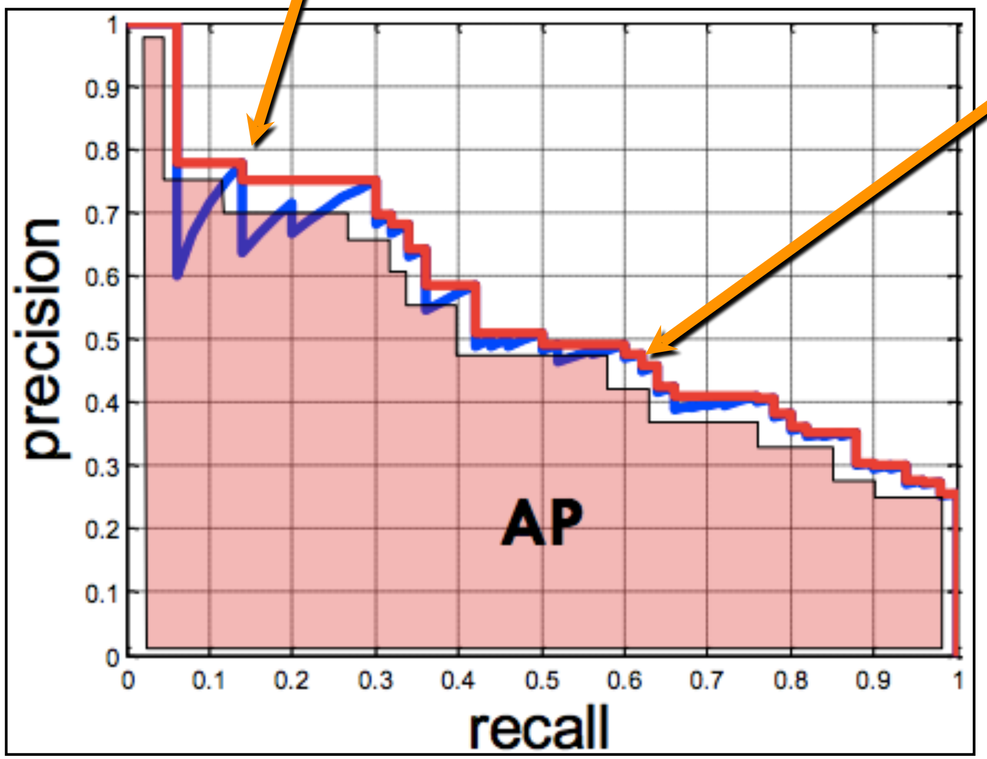
$$\frac{\checkmark}{\checkmark + X} = 100\%$$

$$recall@t = \frac{\#true\ positives@t}{\#ground\ truth\ objects}$$

$$\frac{\checkmark}{\square} = 25\%$$

Average Precision for a (class, IOU threshold) pair





Average Precision (AP)

0% is worst

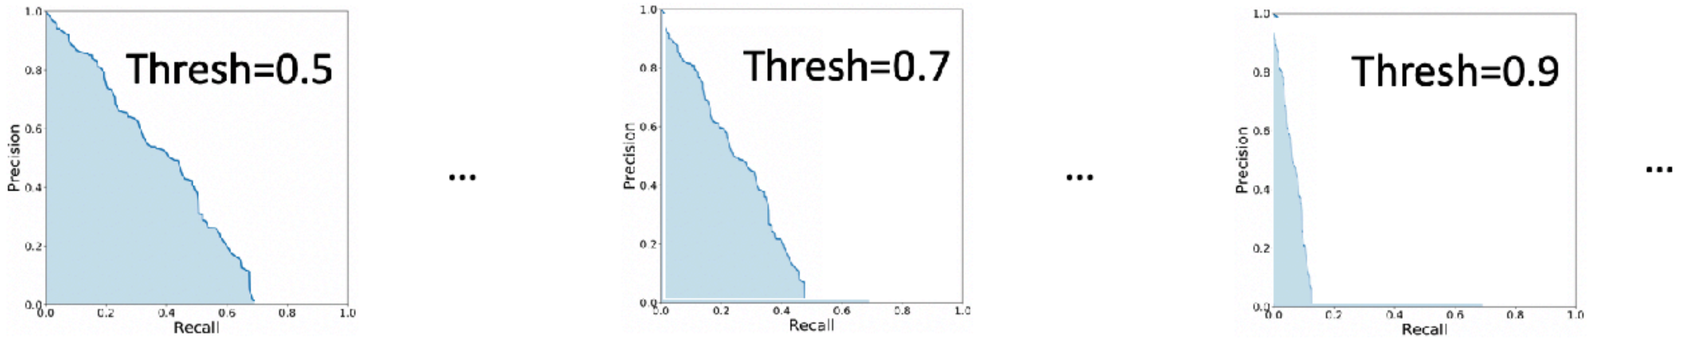
100% is best

mean AP over classes (mAP)

AP(class, threshold): area under PR curve

Average Precision for a class

$$AP(class) = \frac{1}{\#thresholds} \sum_{iou \in threshold} AP(class, iou)$$



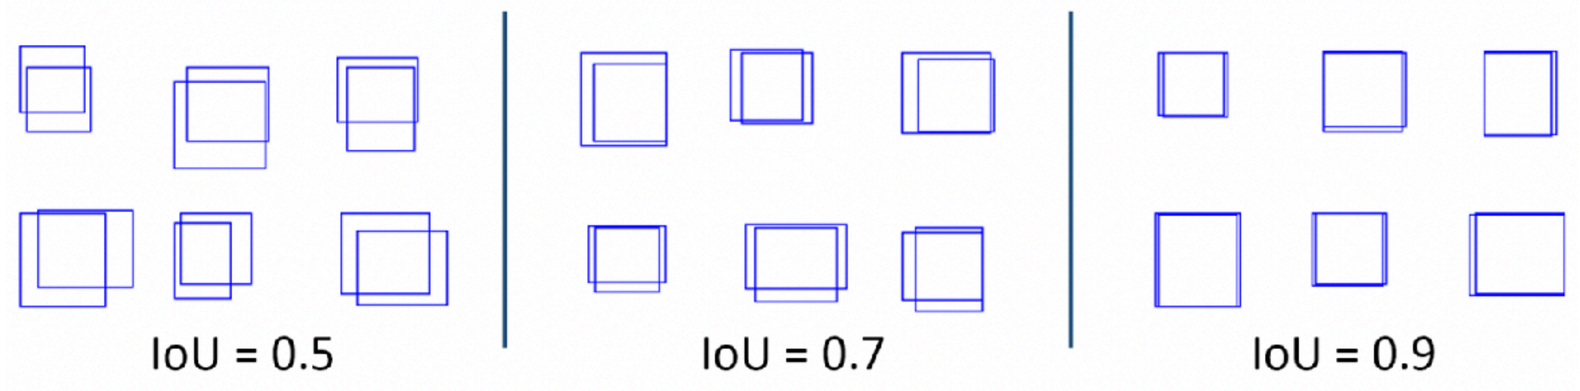


Figure credits: Dollár and Zitnick

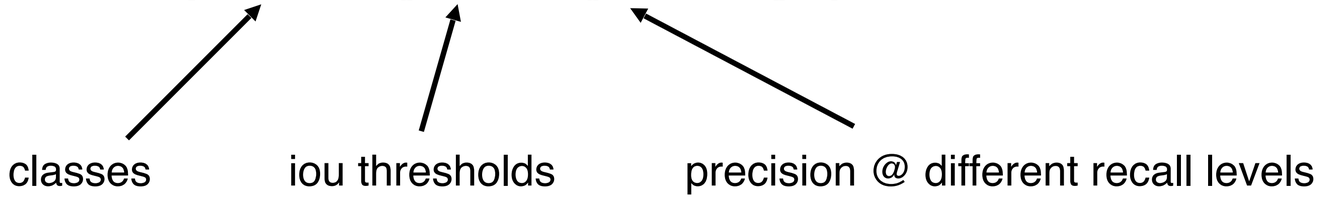
Slides modified from Ross Girshick tutorial at CVPR 2019

Overall Average Precision (%)

$$AP = \frac{1}{\#classes} \sum_{class \in classes} AP(class)$$

“AP” is really an average, average, average precision.



```
Average Precision (AP):
   AP                  % AP at IoU=.50:.05:.95 (primary challenge metric)
   AP^IoU=.50          % AP at IoU=.50 (PASCAL VOC metric)
   AP^IoU=.75          % AP at IoU=.75 (strict metric)
AP Across Scales:
   AP^small            % AP for small objects: area < 32^2
   AP^medium           % AP for medium objects: 32^2 < area < 96^2
   AP^large            % AP for large objects: area > 96^2
```

Object detection: naive attempt

Find the chair in this image

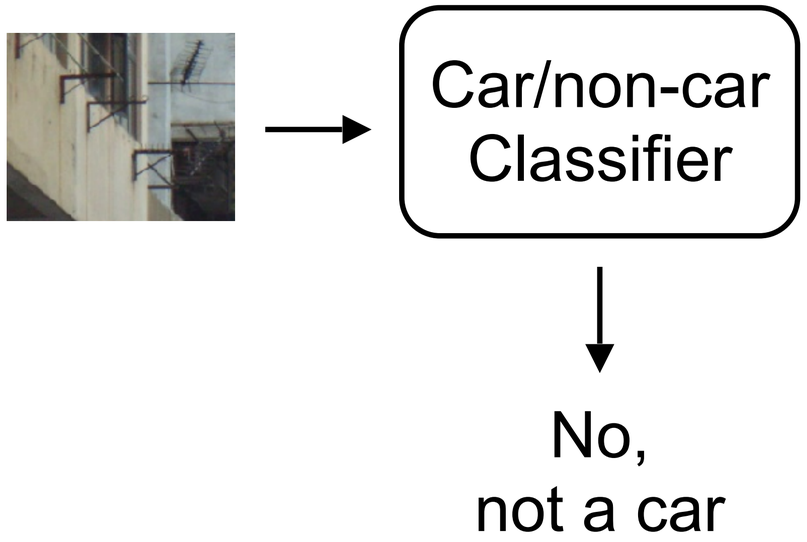
Pretty much garbage
Simple template matching is not going to make it

Slide credit: A. Torralba

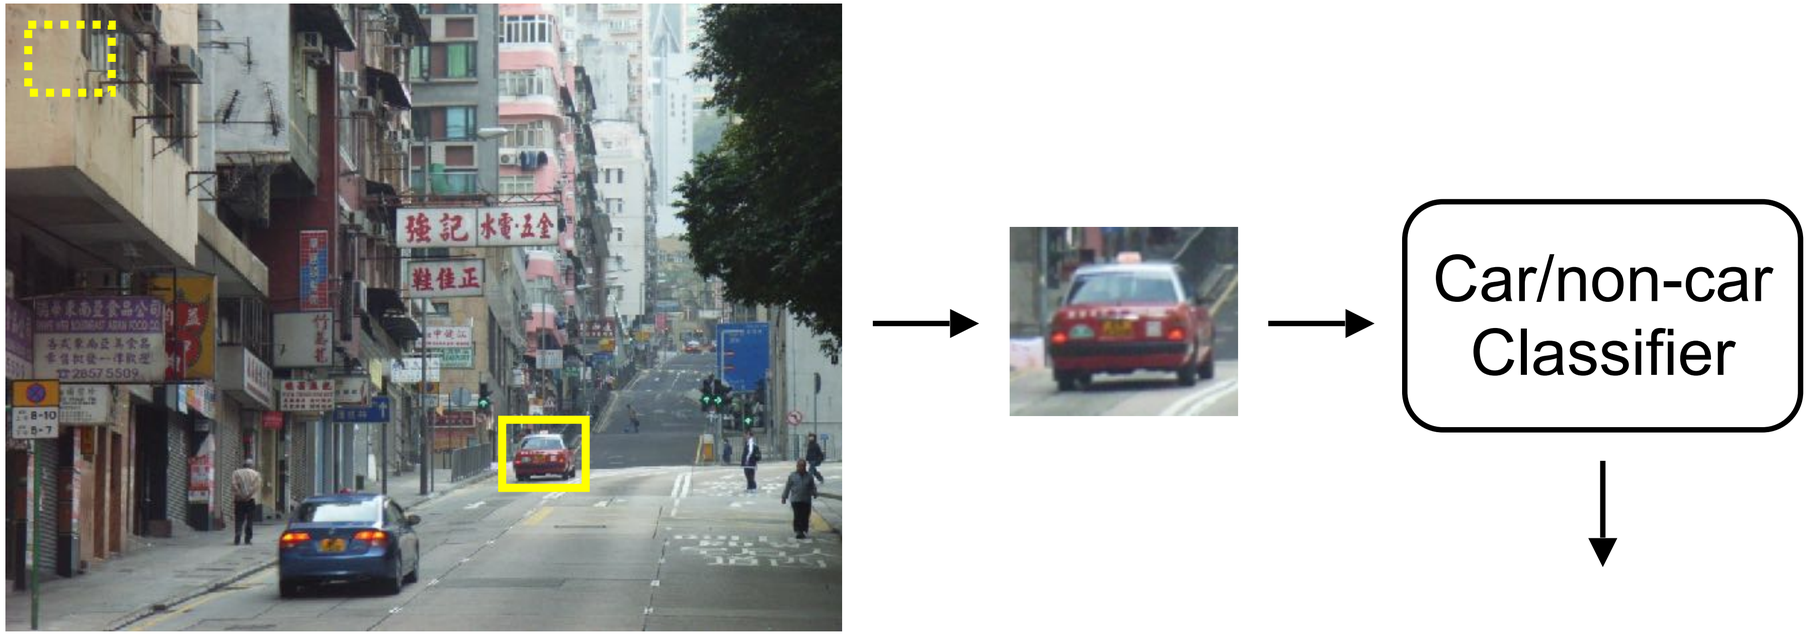
Detection by Classification

- Basic component: binary classifier



Detection by Classification

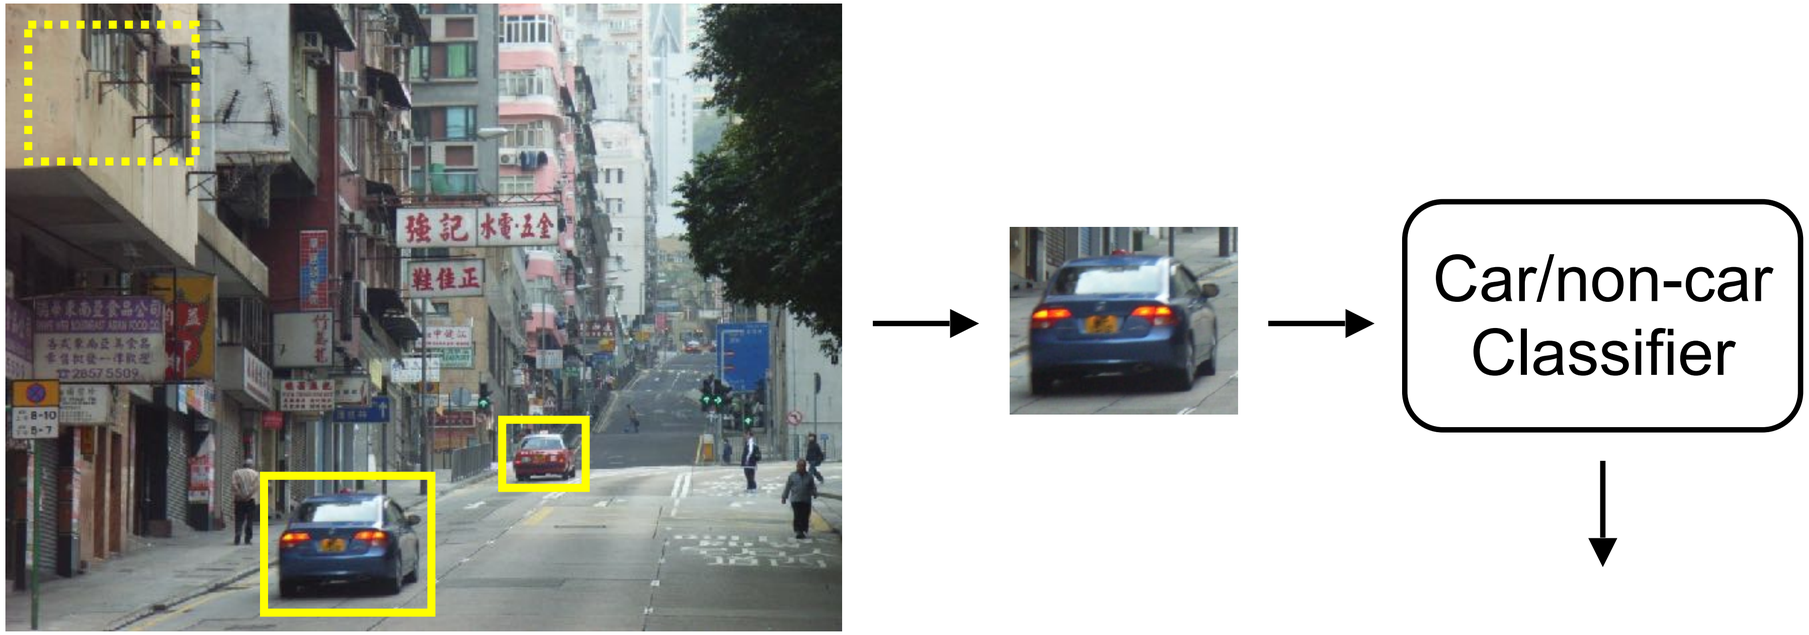
- Detect objects in clutter by **search**



- **Sliding window**: exhaustive search over position and scale

Detection by Classification

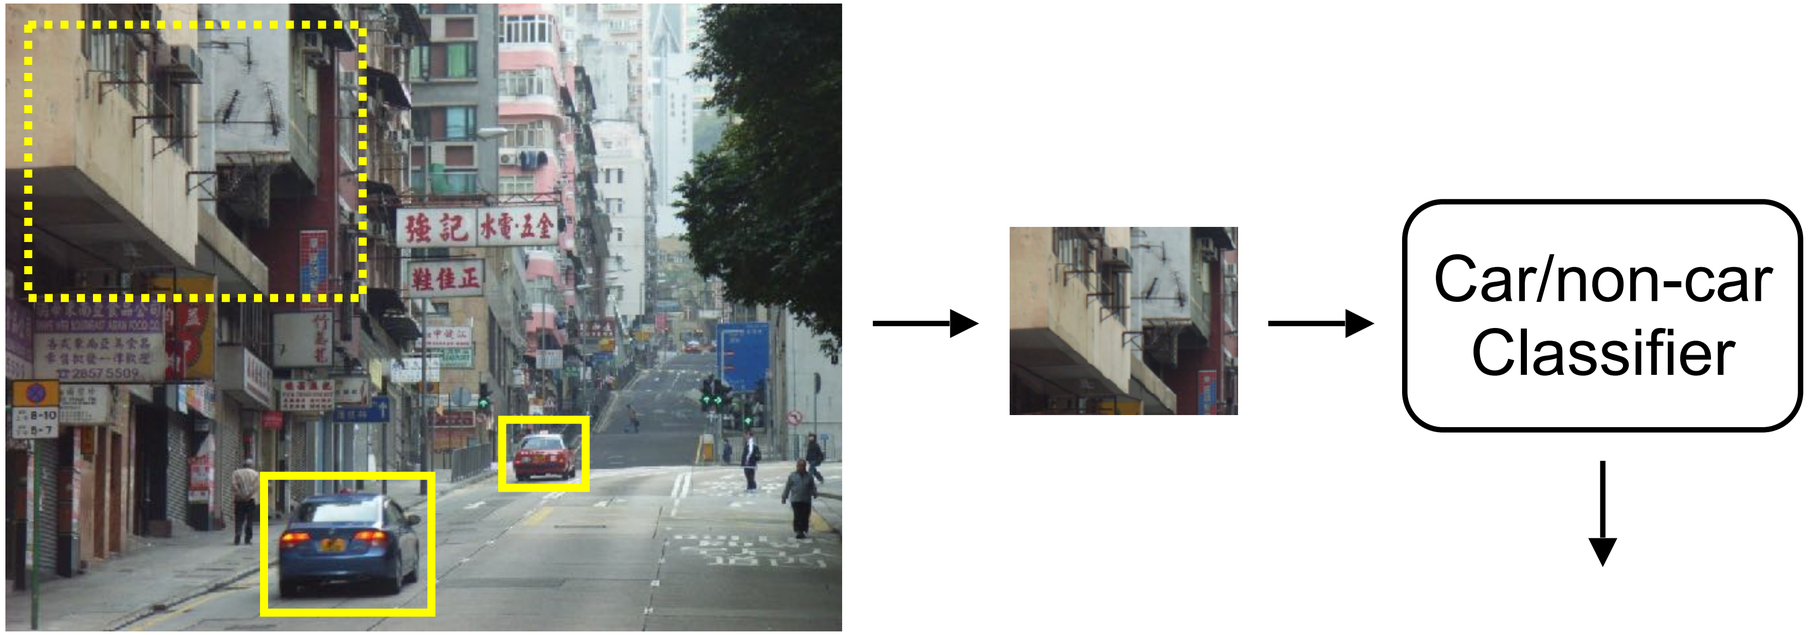
- Detect objects in clutter by **search**



- **Sliding window**: exhaustive search over position and scale

Detection by Classification

- Detect objects in clutter by **search**

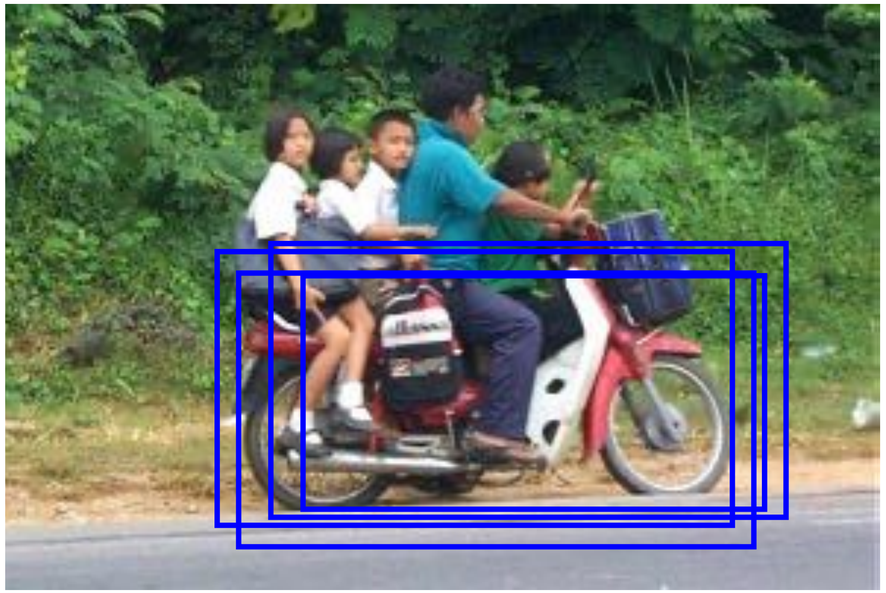


- **Sliding window**: exhaustive search over position and scale

(can use same size window over a spatial pyramid of images)

Test: Non-maximum suppression (NMS)

- Scanning-window detectors typically result in multiple responses for the same object

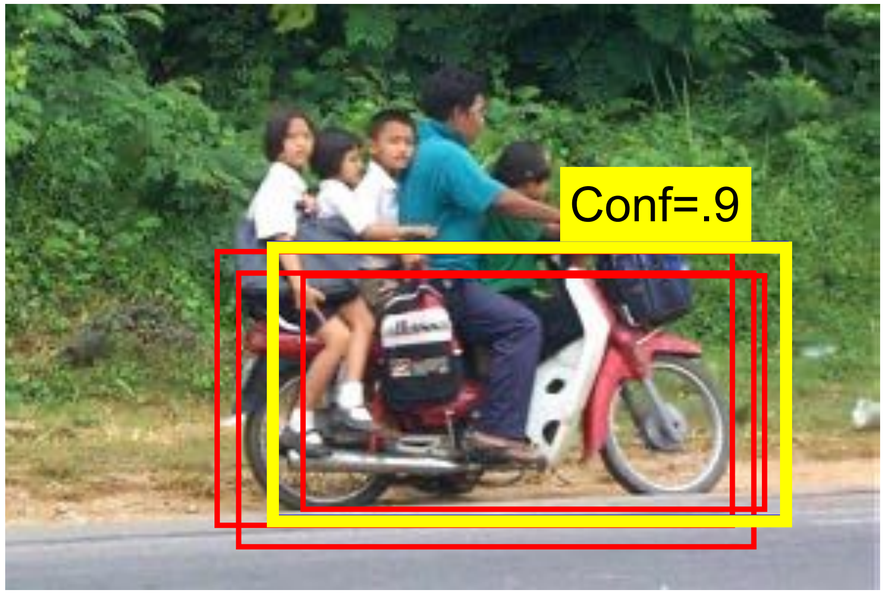


- To remove multiple responses, a simple greedy procedure called “Non-maximum suppression” is applied:

NMS:
1. Sort all detections by detector confidence
2. Choose most confident detection d_i; remove all d_j s.t. $overlap(d_i,d_j)>T$
3. Repeat Step 2. until convergence

Test: Non-maximum suppression (NMS)

- Scanning-window detectors typically result in multiple responses for the same object

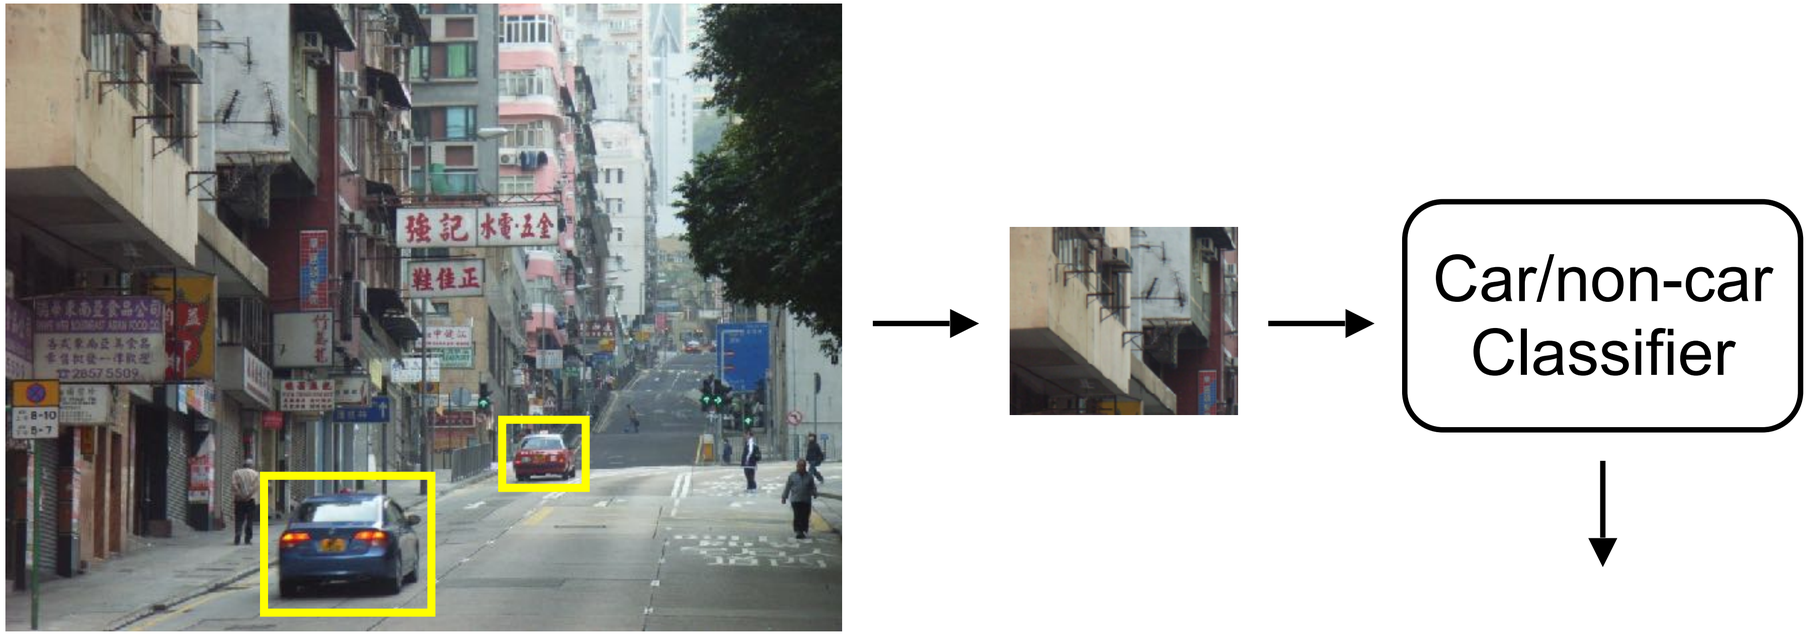


- To remove multiple responses, a simple greedy procedure called “Non-maximum suppression” is applied:

NMS:
1. Sort all detections by detector confidence
2. Choose most confident detection d_i; remove all d_j s.t. $overlap(d_i,d_j)>T$
3. Repeat Step 2. until convergence

Detection by Classification

- Detect objects in clutter by **search**



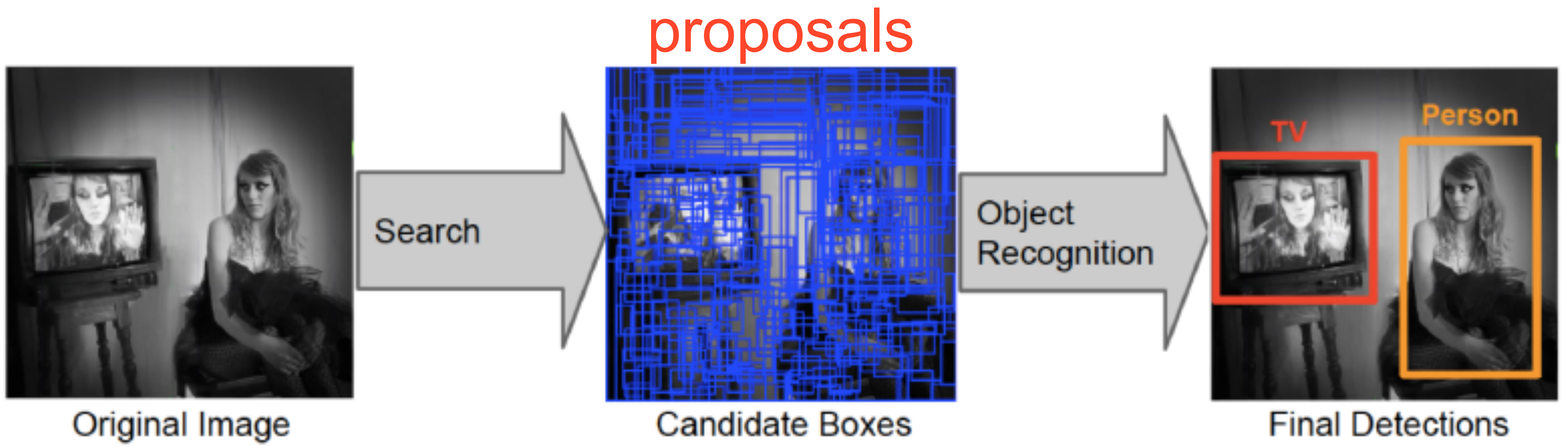
Problem: too many windows to run a classifier

- **Sliding window**: exhaustive search over position and scale

(can use same size window over a spatial pyramid of images)

Object proposals

Generate and evaluate a few hundred region proposals.



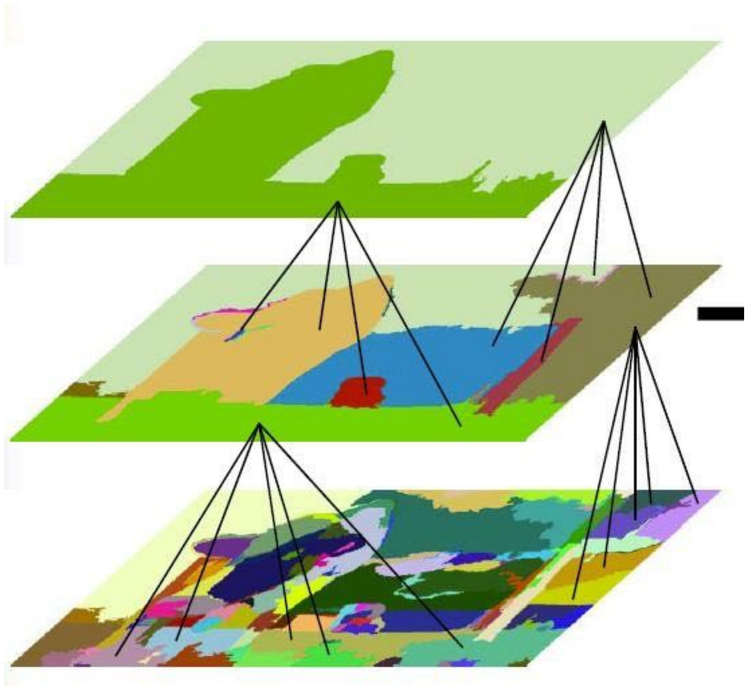
- Proposal mechanism can:
  - ➡ take advantage of low-level perceptual organization cues,
  - ➡ be category-specific or category-independent, handcrafted or trained.

- Classifier can be slower but more powerful.

Slide credit: Lana Lazebnk

Region proposals: Selective search

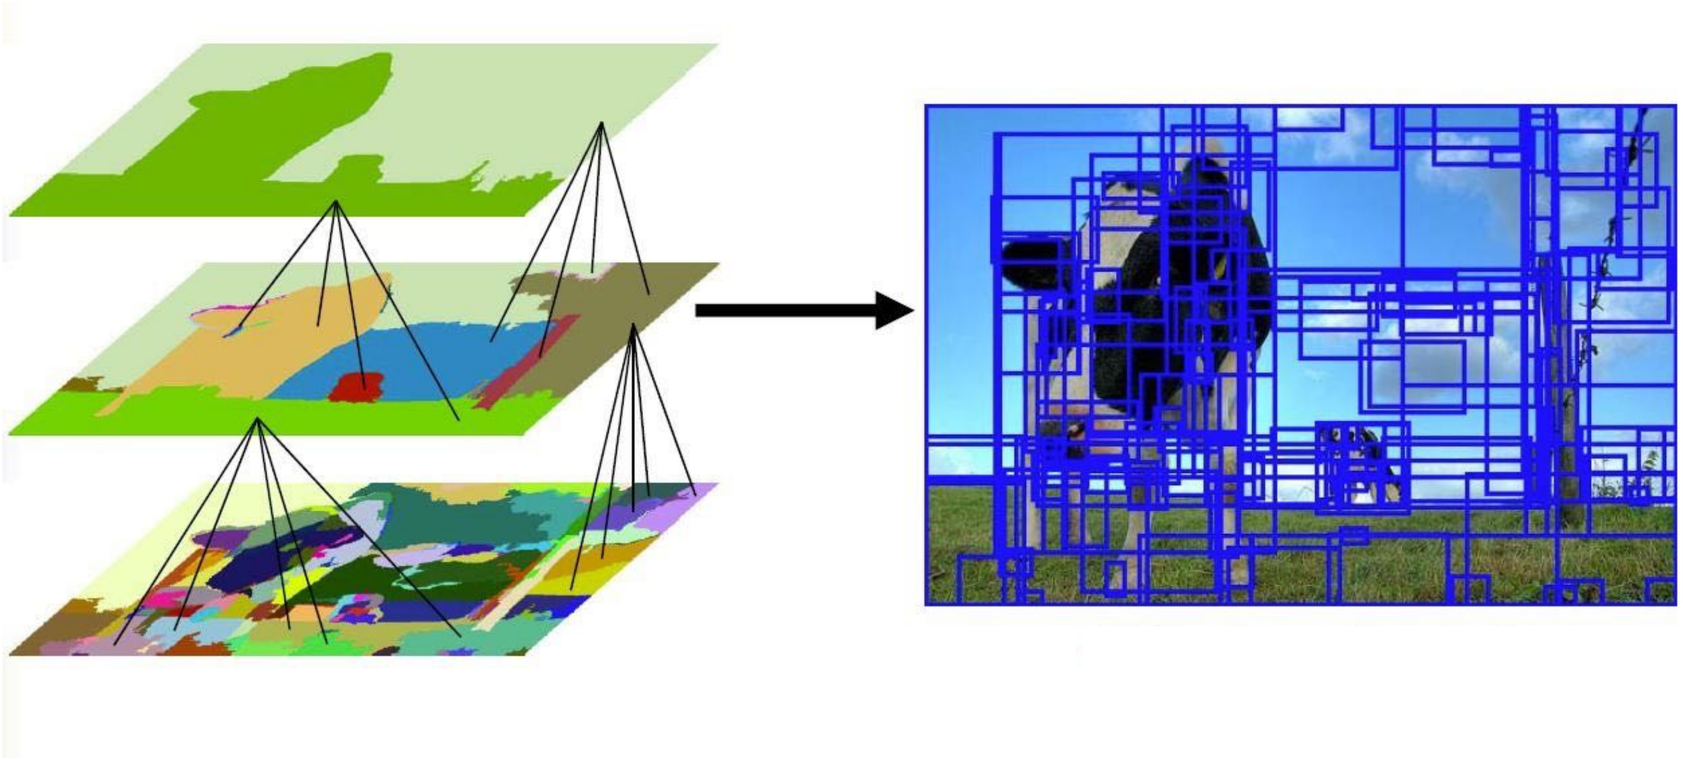
1. Merge two most similar regions based on similarity.
2. Update similarities between the new region and its neighbors.
3. Go back to step 1. until the whole image is a single region.



[K. van de Sande, J. Uijlings, T. Gevers, and A. Smeulders, ICCV 2011]

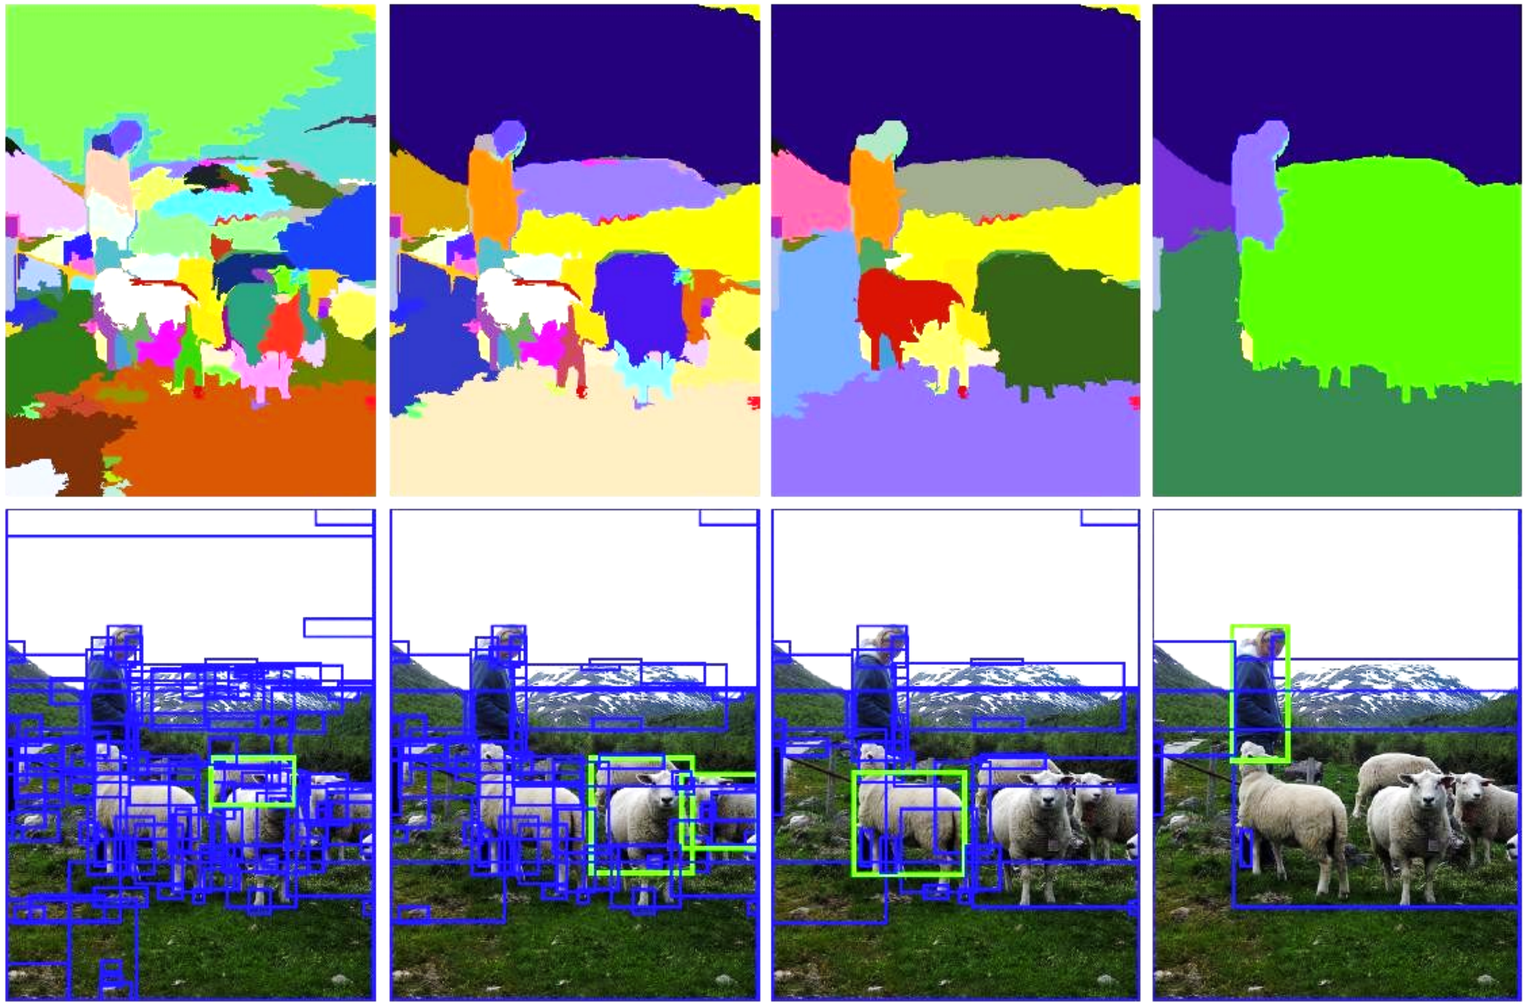
Region proposals: Selective search

Take bounding boxes of all generated regions and treat them as possible object locations.



[K. van de Sande, J. Uijlings, T. Gevers, and A. Smeulders, ICCV 2011]

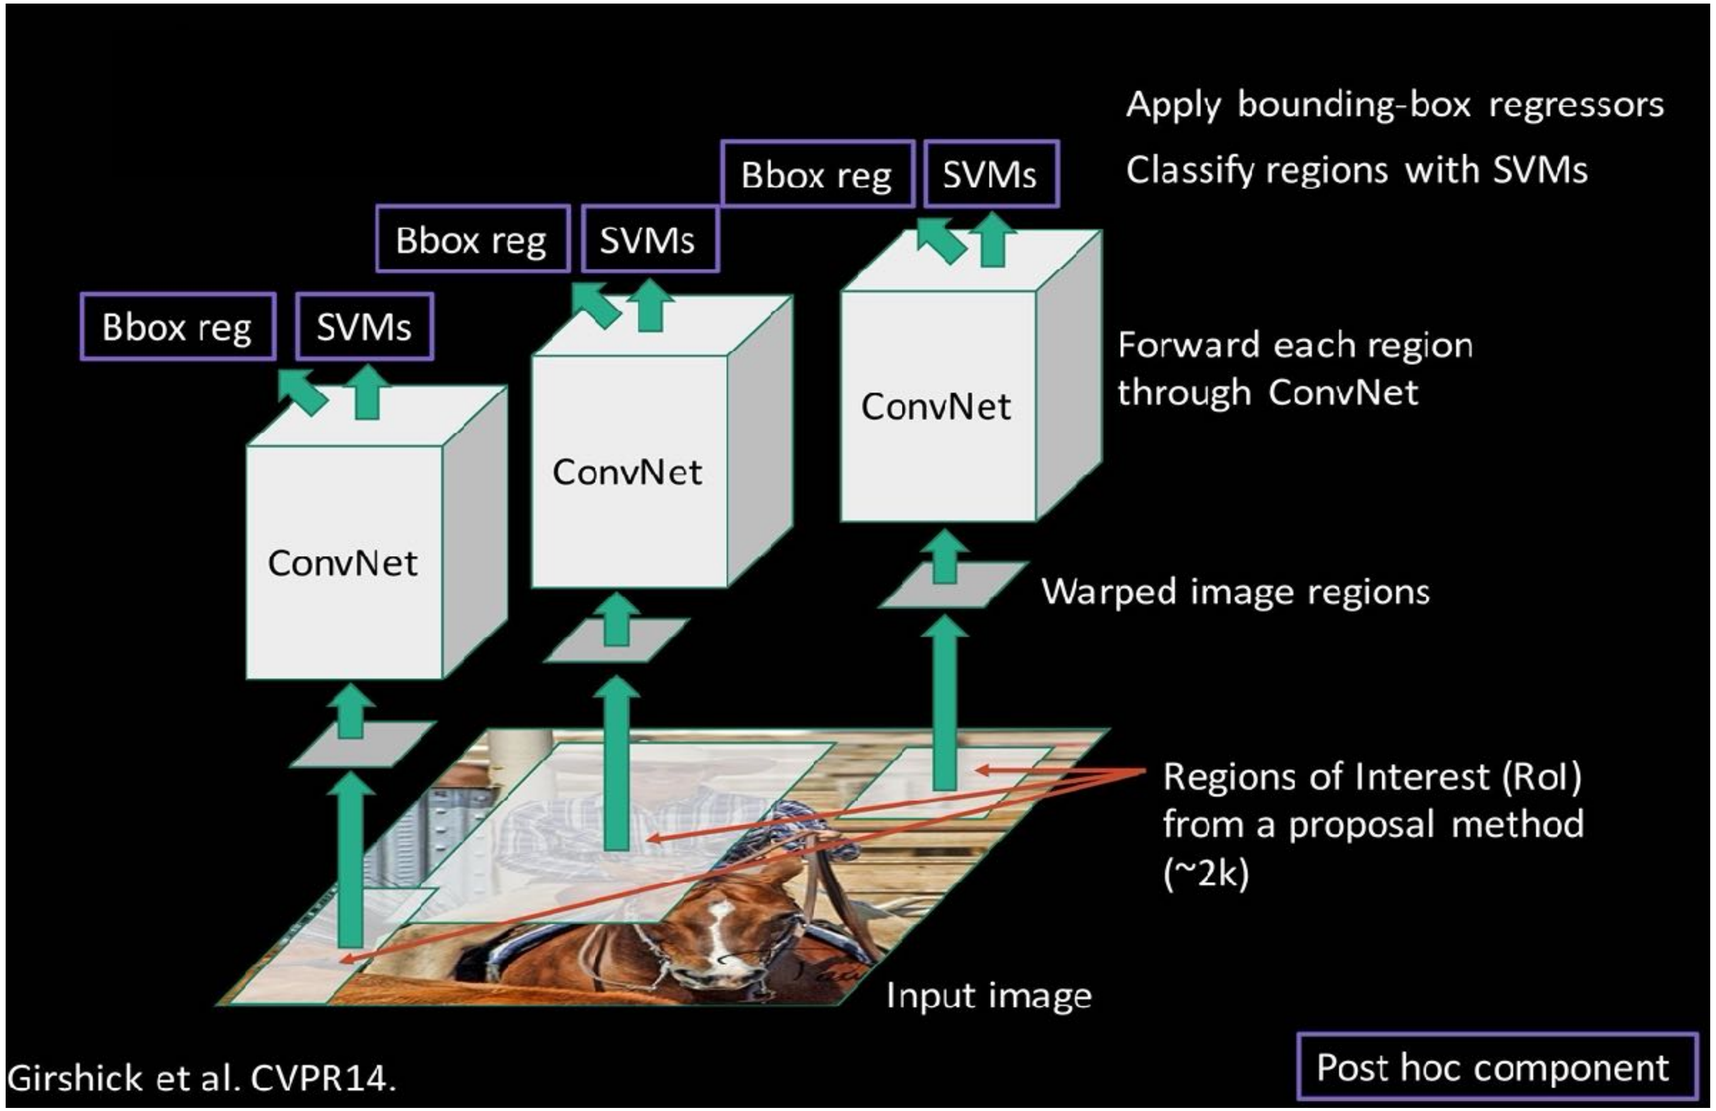
Region proposals: Selective search



[K. van de Sande, J. Uijlings, T. Gevers, and A. Smeulders, ICCV 2011]

Object detection: CNN-based methods

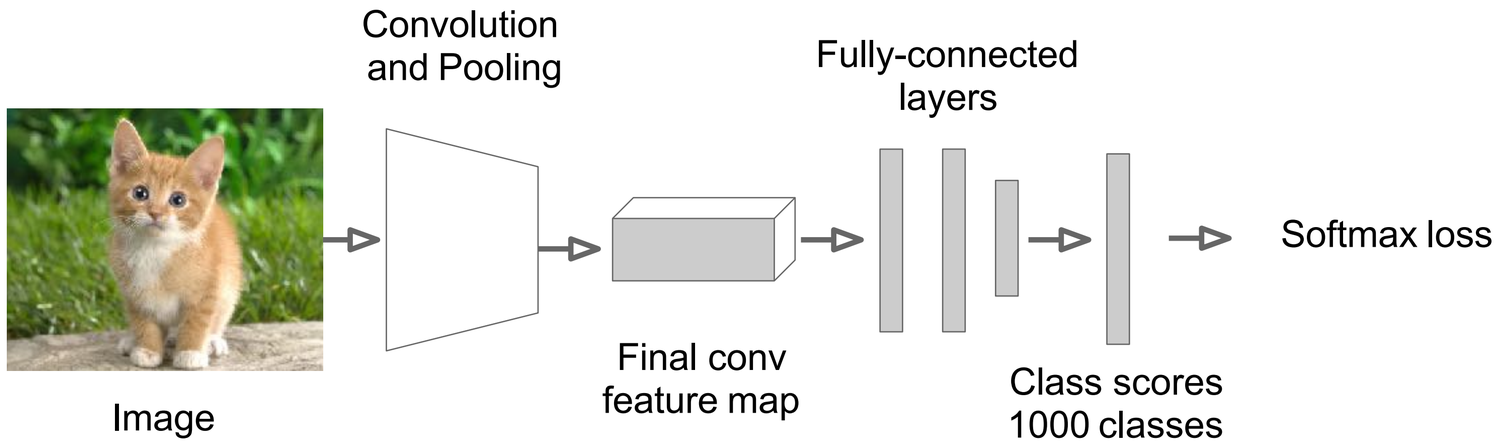
R-CNN: Region-based CNN



Slide credit: Ross Girschick [Girschick et al, “Rich feature hierarchies for accurate object detection and semantic segmentation”, CVPR 2014]

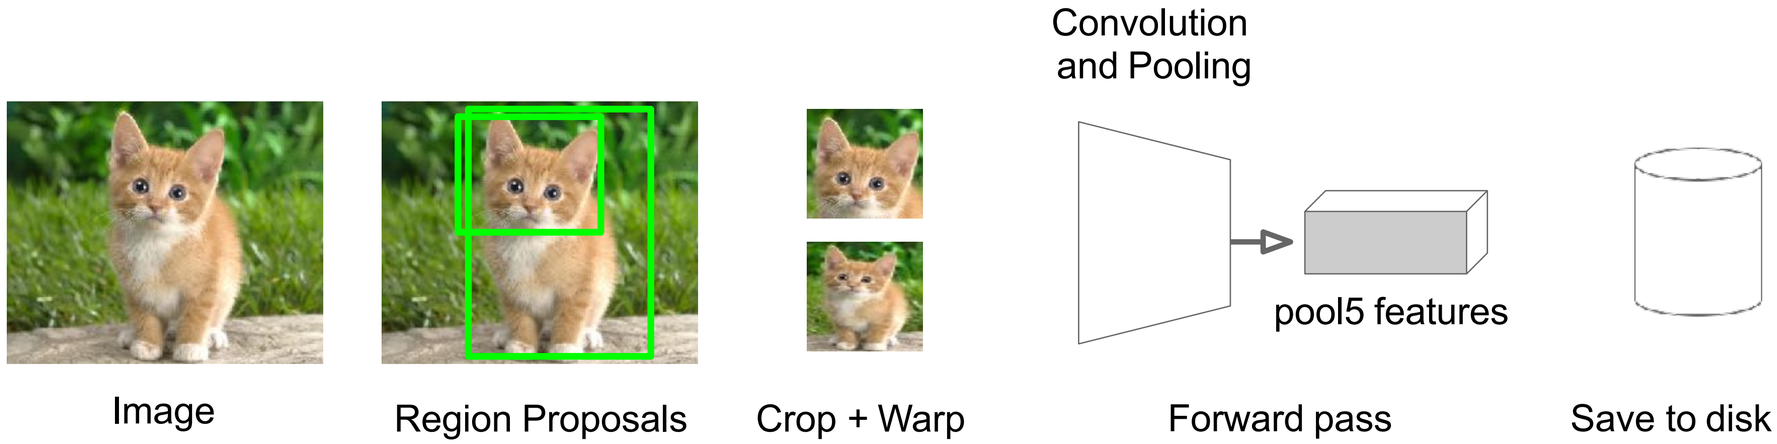
R-CNN Training

Step 1: Train (or download) a classification model for ImageNet (AlexNet)



R-CNN Training

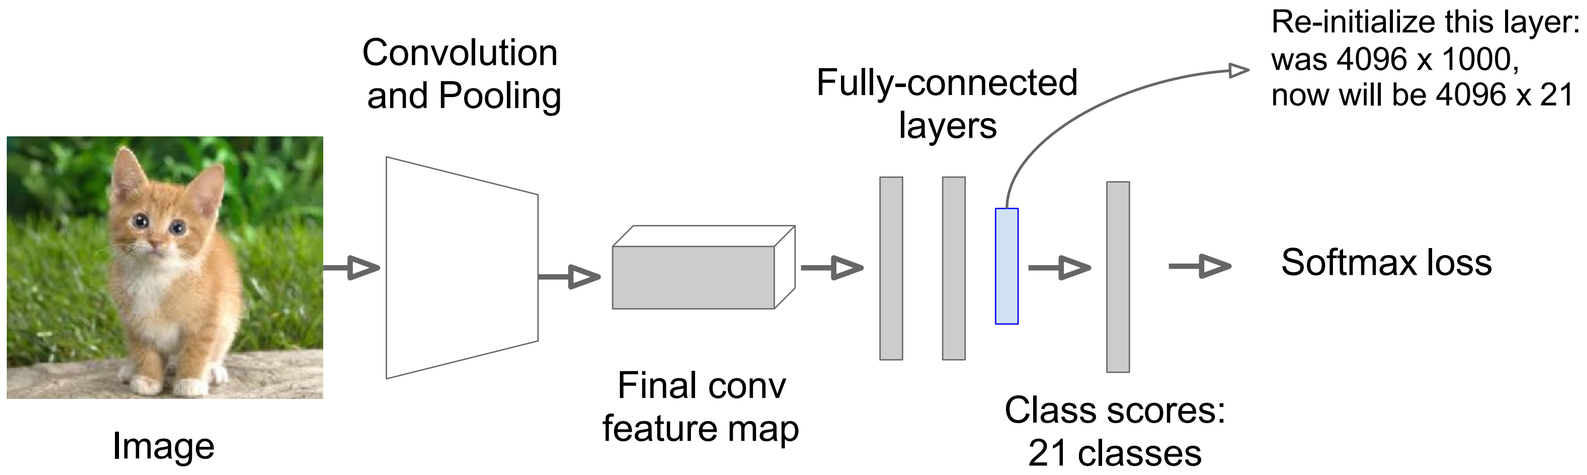
Step 2: Extract features
- Extract region proposals for all images
- For each region: warp to CNN input size, run forward through CNN, save pool5 features to disk
- Have a big hard drive: features are ~200GB for PASCAL dataset!



R-CNN Training

Step 3: Fine-tune model for detection

- Instead of 1000 ImageNet classes, want 20 object classes + background
- Throw away final fully-connected layer, reinitialize from scratch
- Keep training model using positive / negative regions from detection images



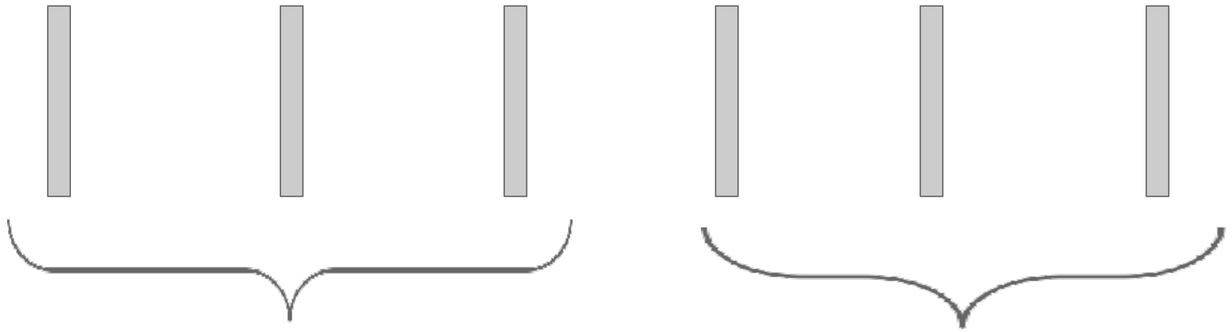
R-CNN Training

(**Go back to Step 2**: Re-extract features with the fine-tuned CNN)

Step 4: Train **one binary SVM per class** to classify region features

Training image regions

Cached region features

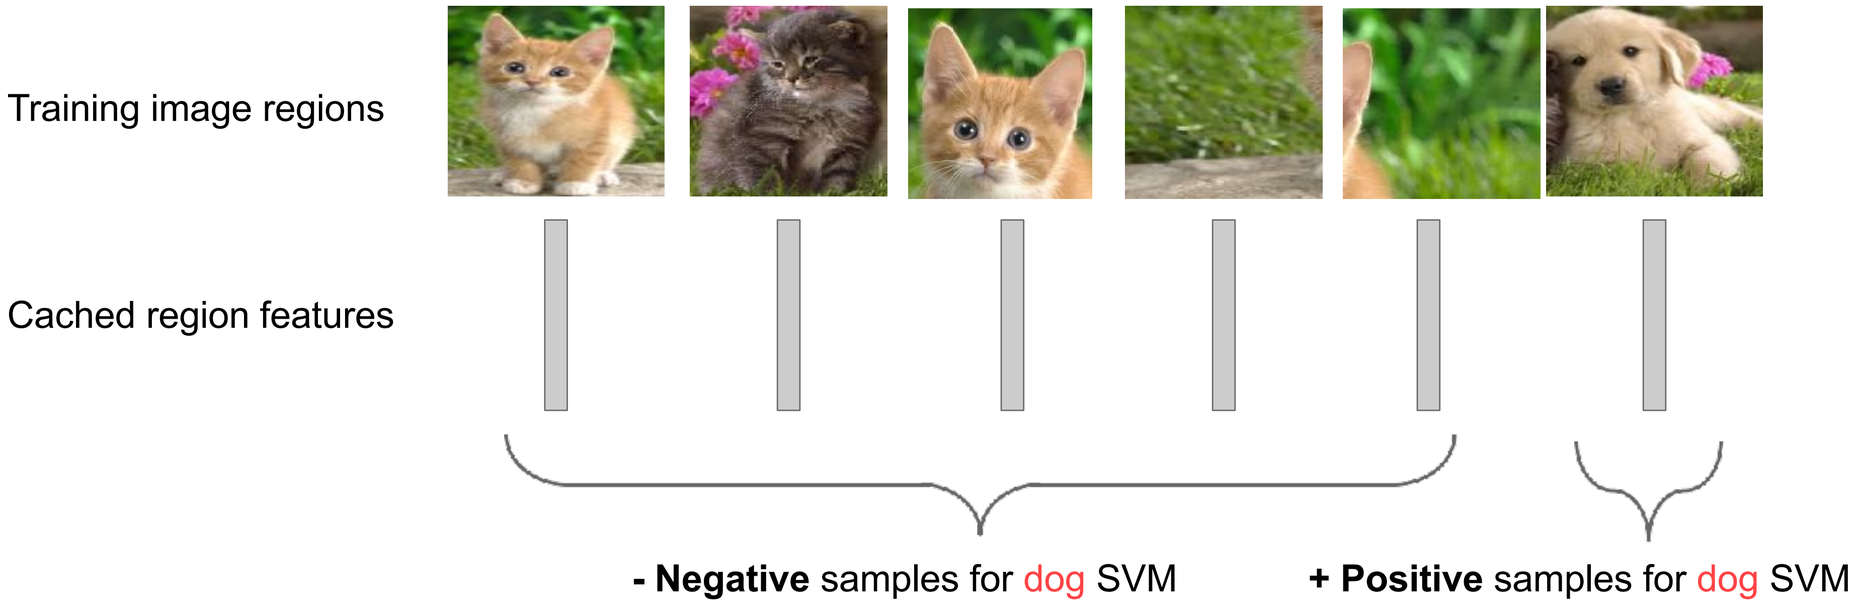


+ Positive samples for cat SVM

- Negative samples for cat SVM

R-CNN Training

Step 4: Train **one binary SVM per class** to classify region features



R-CNN Training

Step 5 (bbox regression): For each class, train a linear regression model to map from cached features to offsets to GT boxes to make up for “slightly wrong” proposals

Training image regions

Cached region features

Regression targets
(dx, dy, dw, dh)
Normalized coordinates

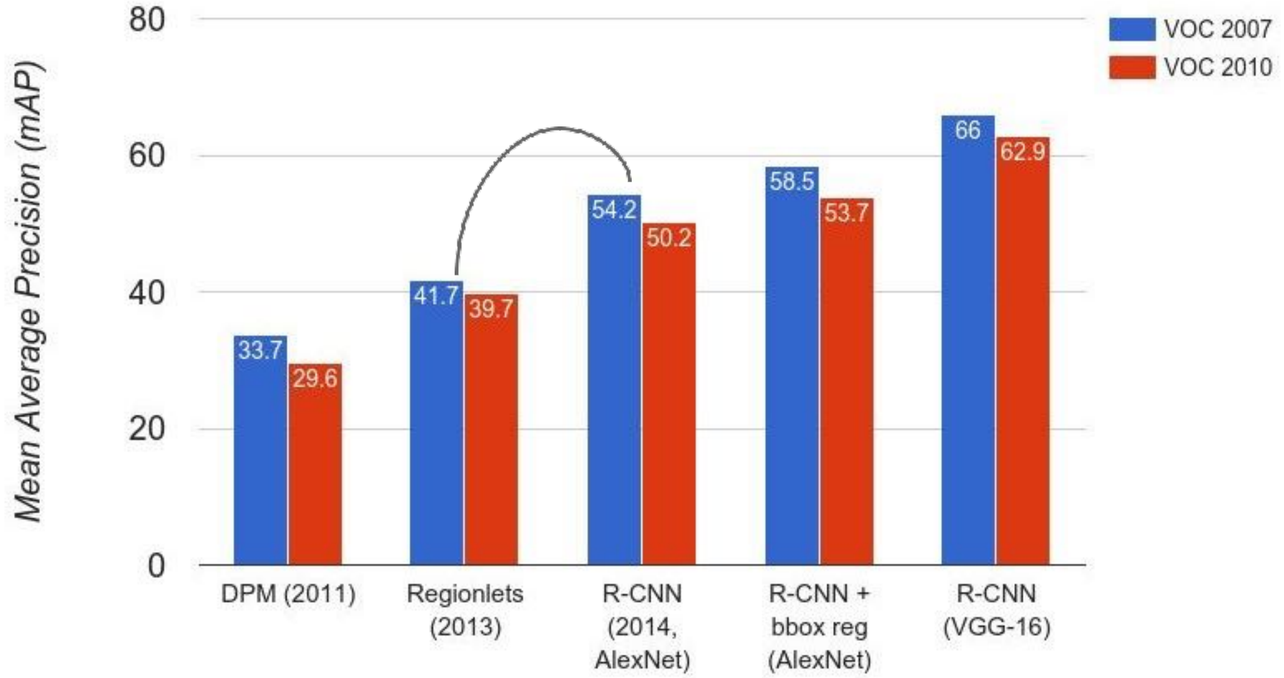
(0, 0, 0, 0)
Proposal is good

(.25, 0, 0, 0)
Proposal too
far to left

(0, 0, -0.125, 0)
Proposal too
wide

R-CNN Results

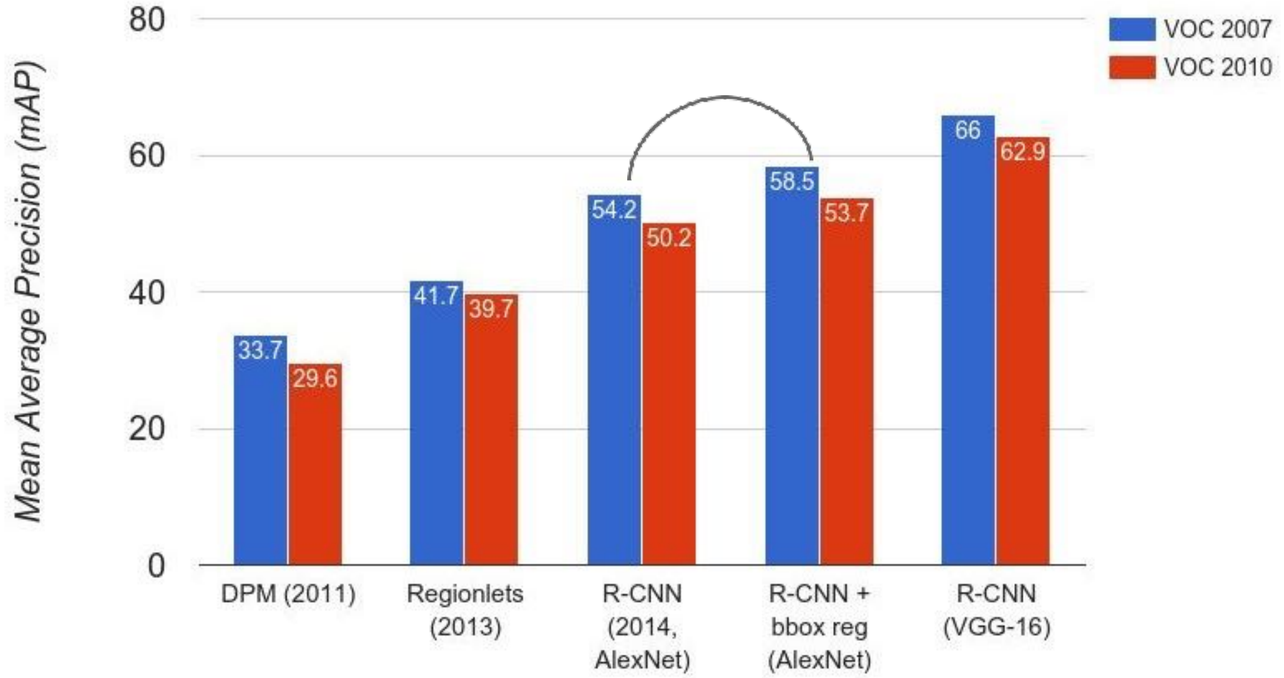
Big improvement compared to pre-CNN methods



Wang et al, “Regionlets for Generic Object Detection”, ICCV 2013

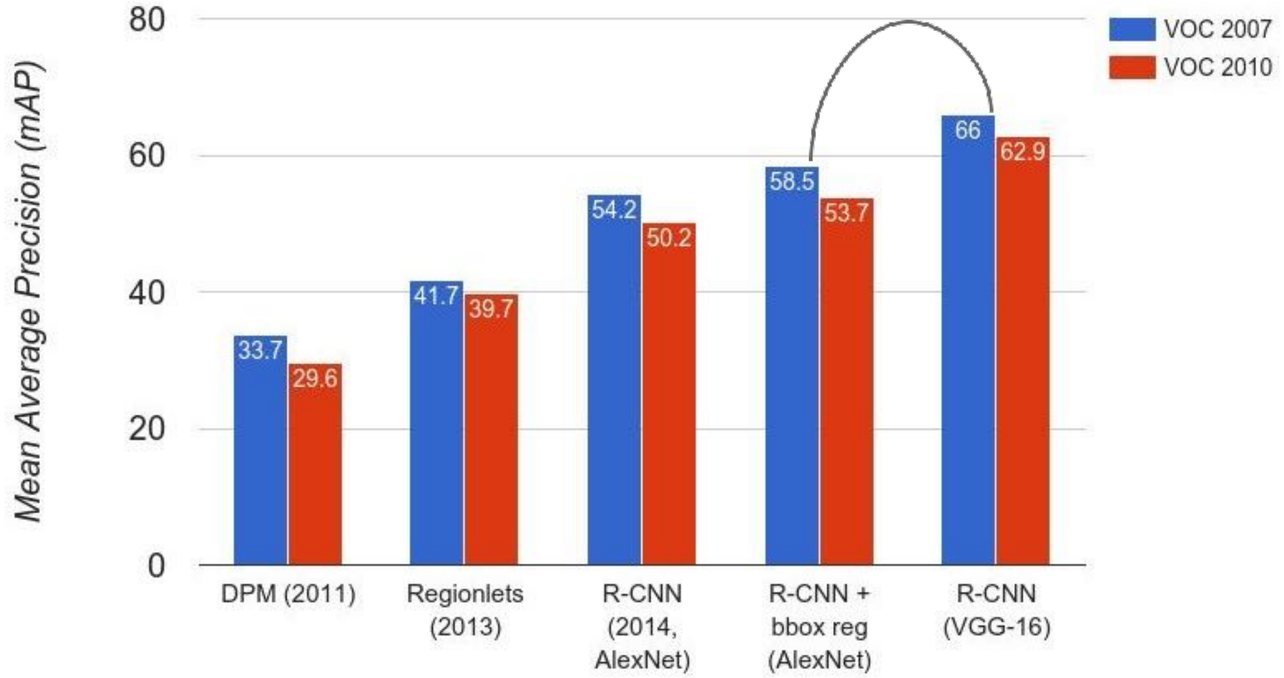
R-CNN Results

Bounding box regression helps a bit



R-CNN Results

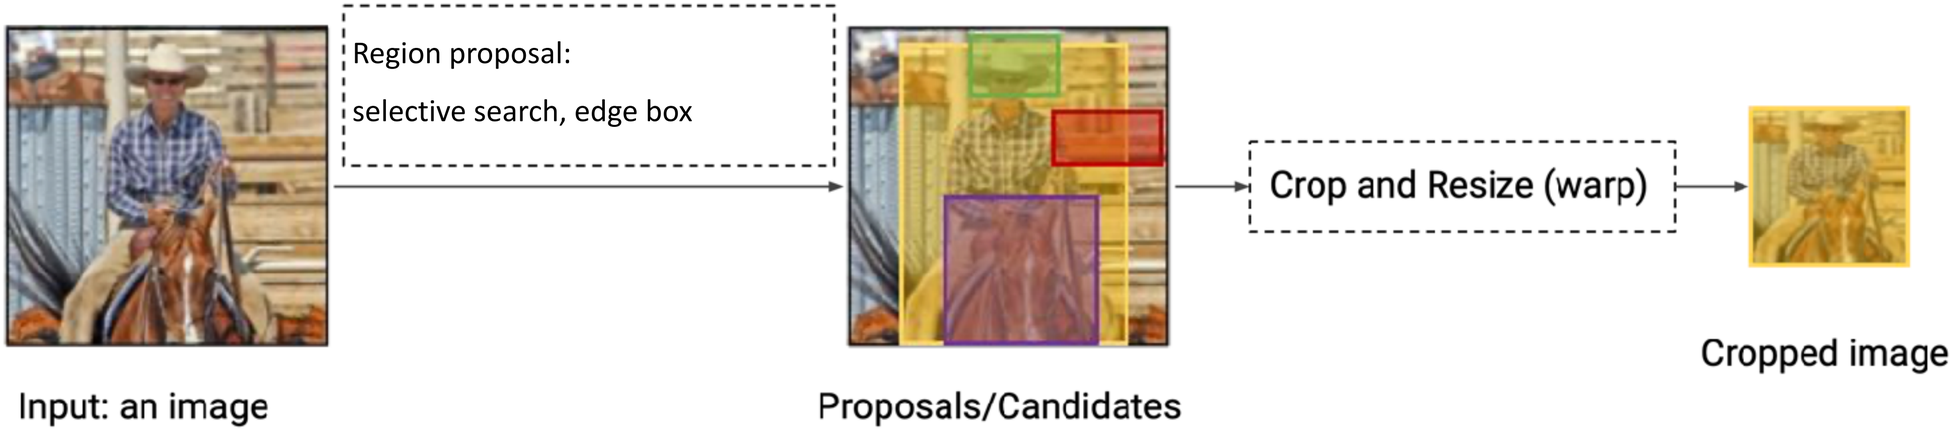
Features from a deeper network help a lot



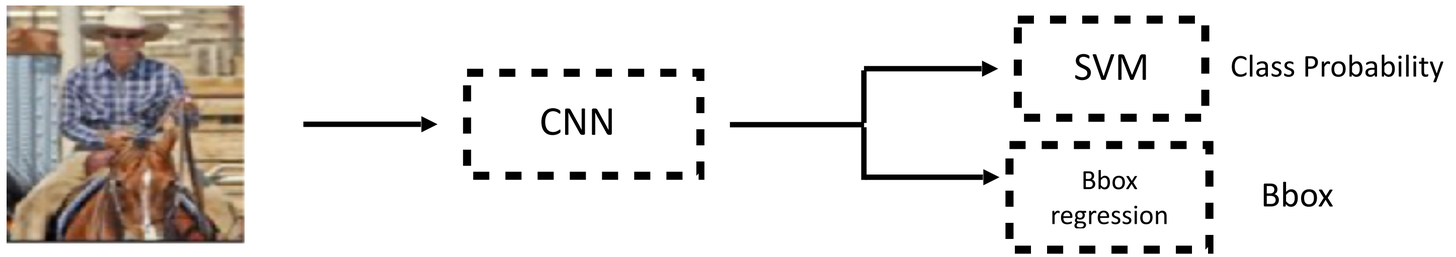
R-CNN [CVPR 2014] Summary

Two-stage detector

- Propose large number of regions potentially with objects



- Classify each proposed region



R. Girshick, J. Donahue, T. Darrell, and J. Malik, Rich Feature Hierarchies for Accurate Object Detection and Semantic Segmentation, CVPR 2014.

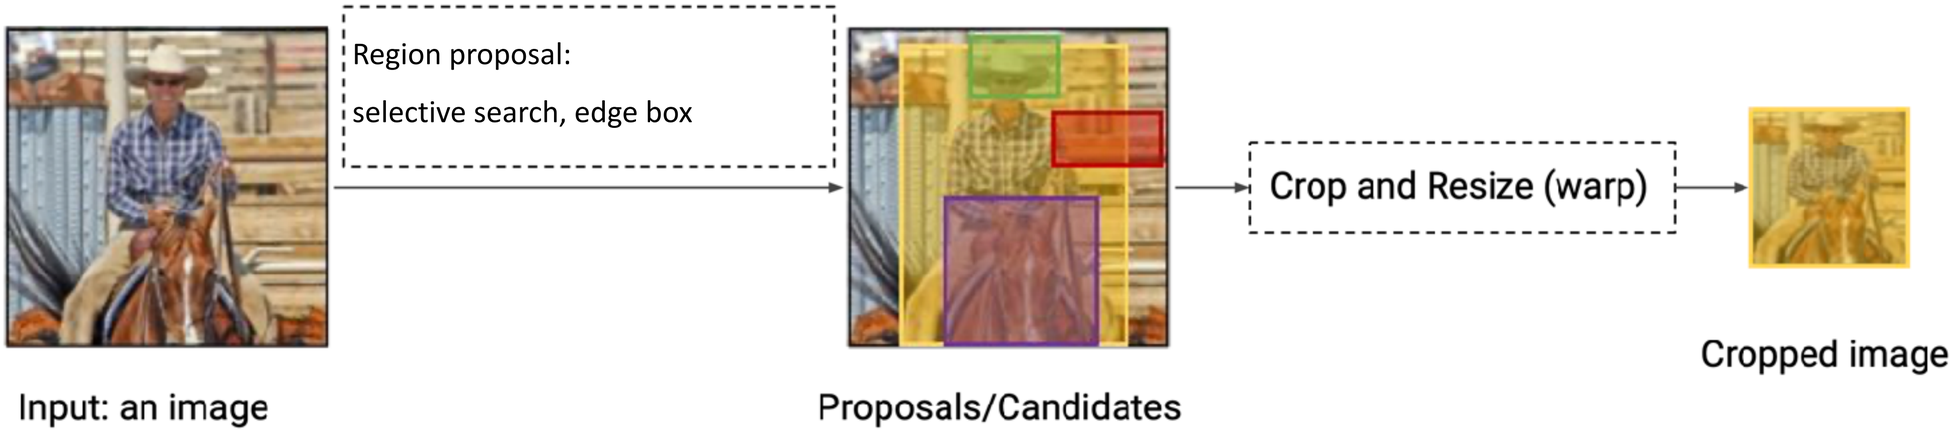
e.g. region proposal: J. Uijlings, K. van de Sande, T. Gevers, and A. Smeulders, Selective Search for Object Recognition, IJCV 2013

Slides modified from Ross Girshick tutorial at CVPR 2019

R-CNN [CVPR 2014] Limitations

Two-stage detector

- Propose large number of regions potentially with objects



- Classify each proposed region

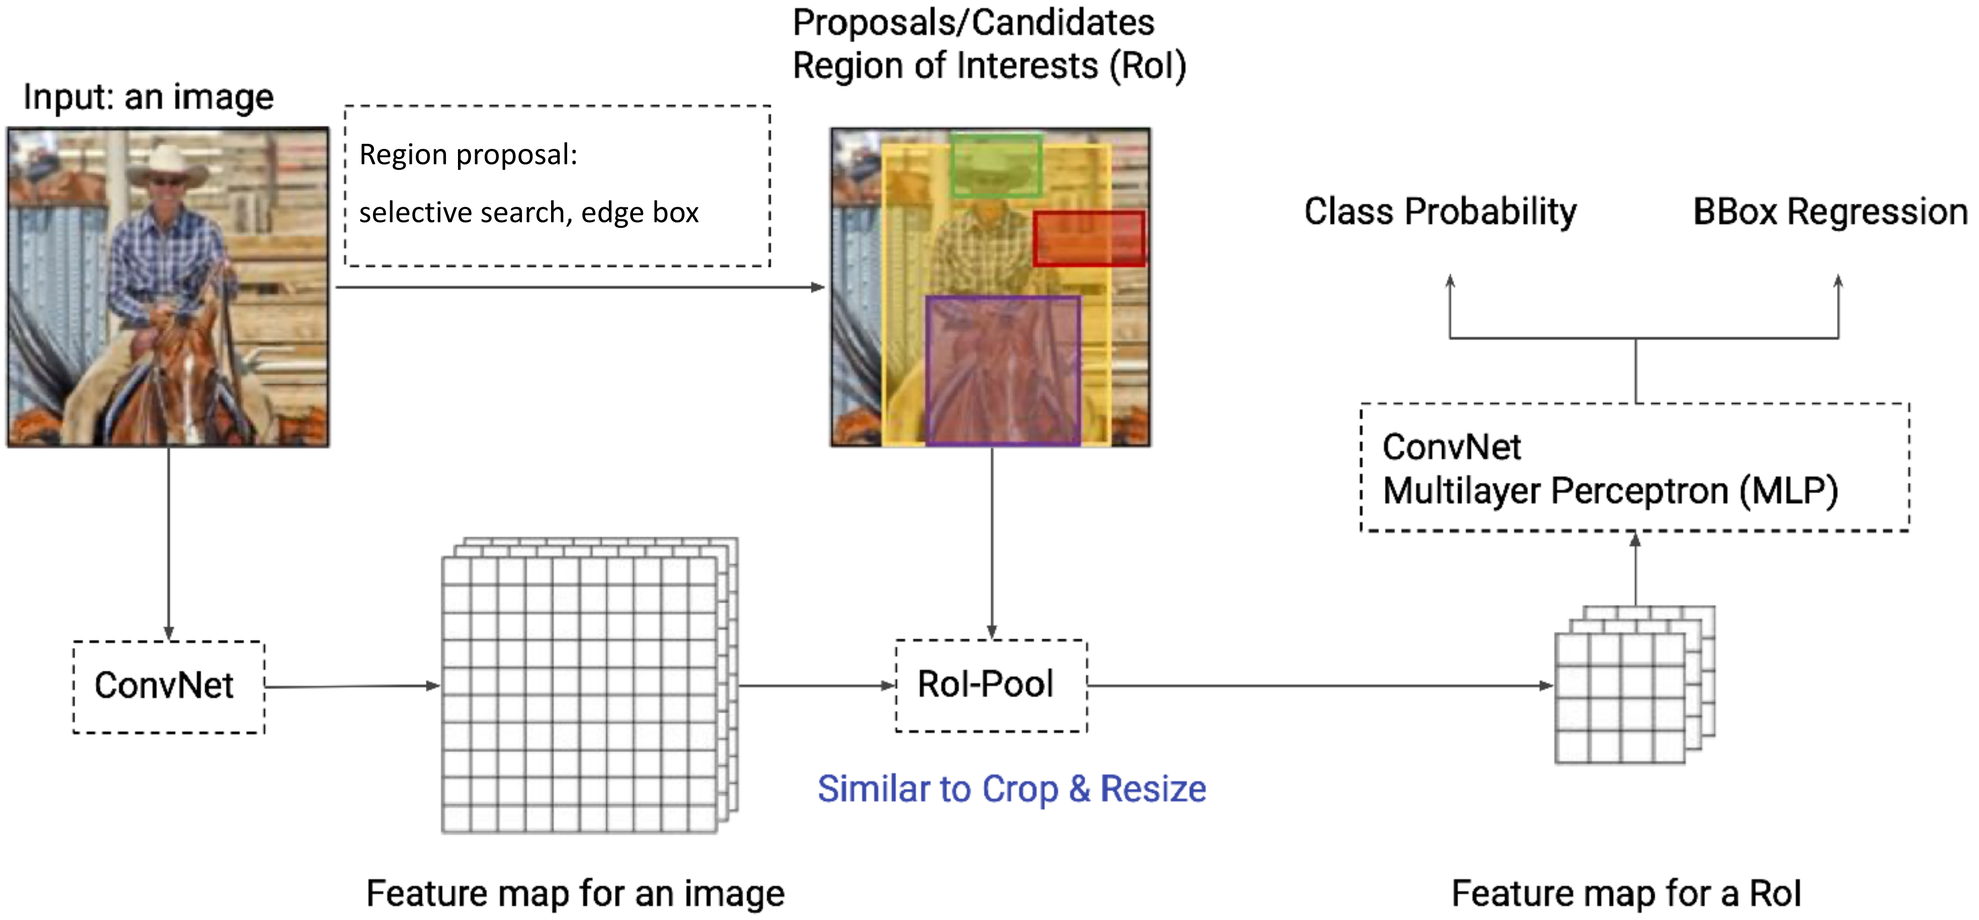
1. **Slow at test-time:** need to run full forward pass of CNN for each region proposal
2. **Not end-to-end:** SVMs and regressors are post-hoc, CNN features not updated in response to SVMs and regressors
3. **Complex** multistage training pipeline

R. Girshick, J. Donahue, T. Darrell, and J. Malik, Rich Feature Hierarchies for Accurate Object Detection and Semantic Segmentation, CVPR 2014.
e.g. region proposal: J. Uijlings, K. van de Sande, T. Gevers, and A. Smeulders, Selective Search for Object Recognition, IJCV 2013

Slides modified from Ross Girshick tutorial at CVPR 2019

Fast R-CNN [ICCV 2015]

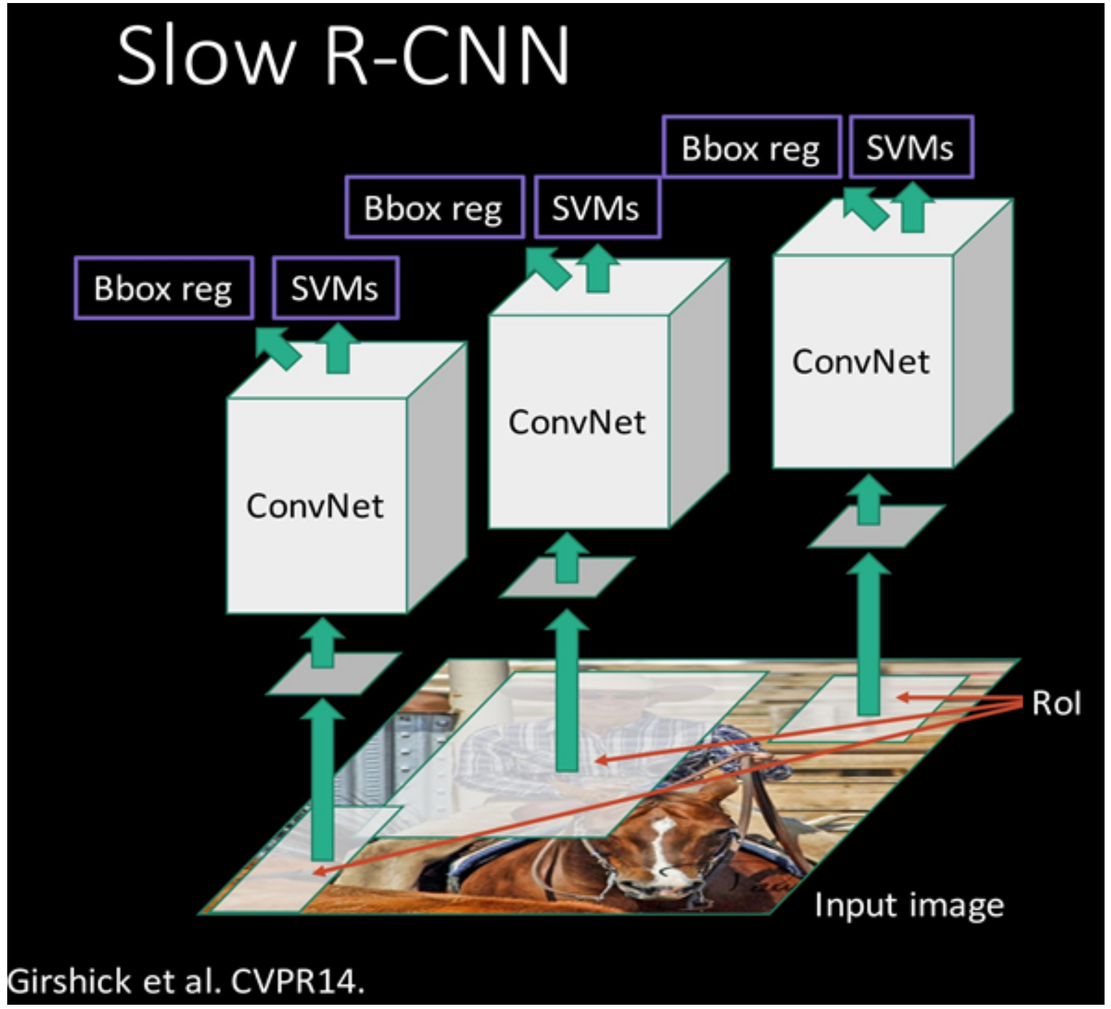
- Small accuracy improvement
- Timing excluding region proposal
  - ~10x faster for training
  - ~100x faster for testing (< 1 sec / image)



R. Girshick, Fast R-CNN, ICCV 2015

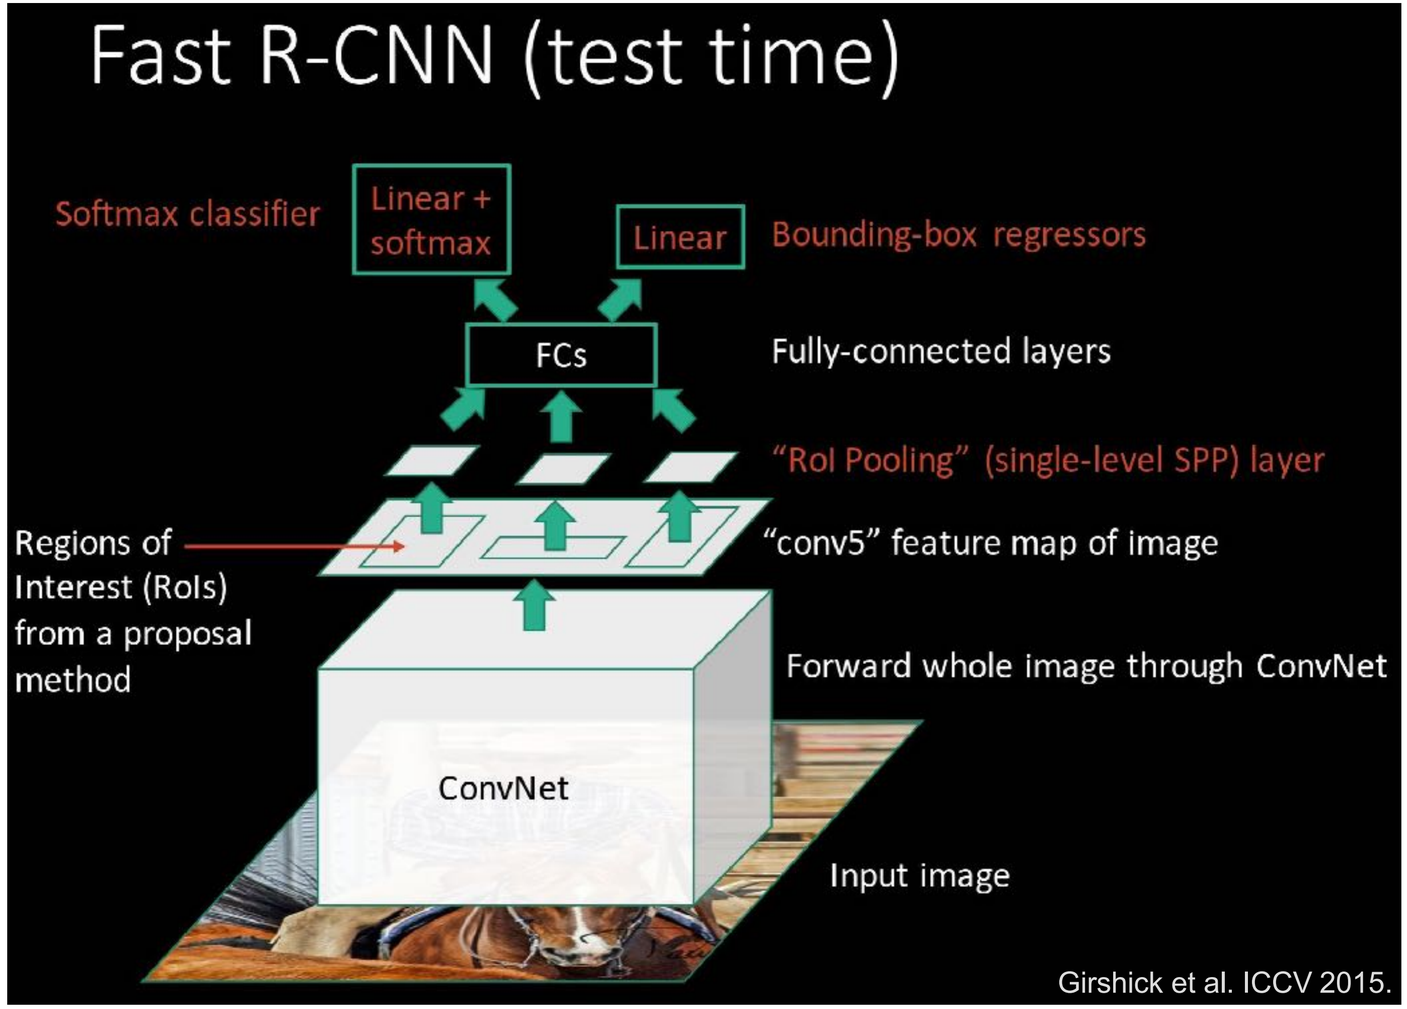
R-CNN Problems

Problem #1: **Slow** at test-time due to **independent forward passes** of the CNN



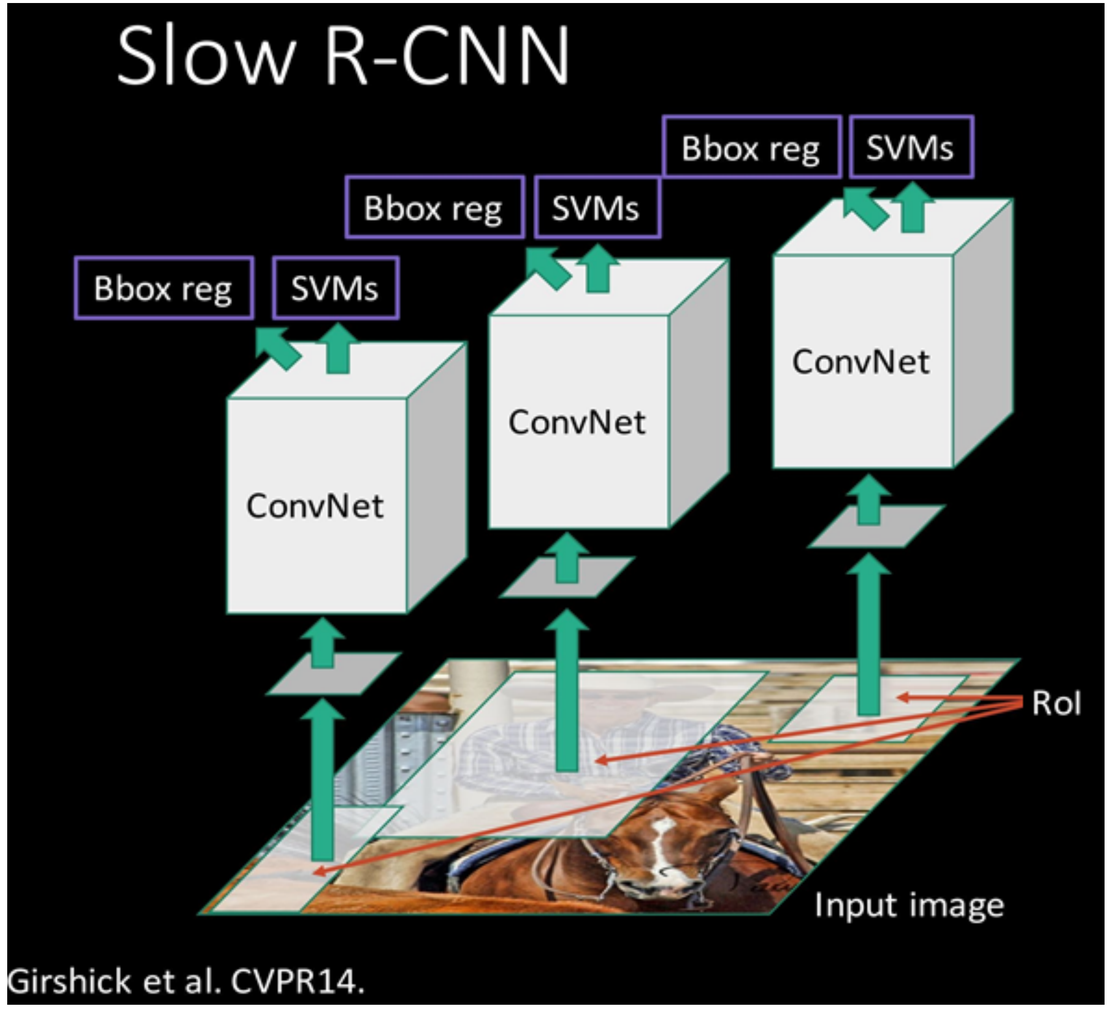
Fast R-CNN Solutions

Solution: **Share computation of convolutional layers** between proposals for an image



R-CNN Problems

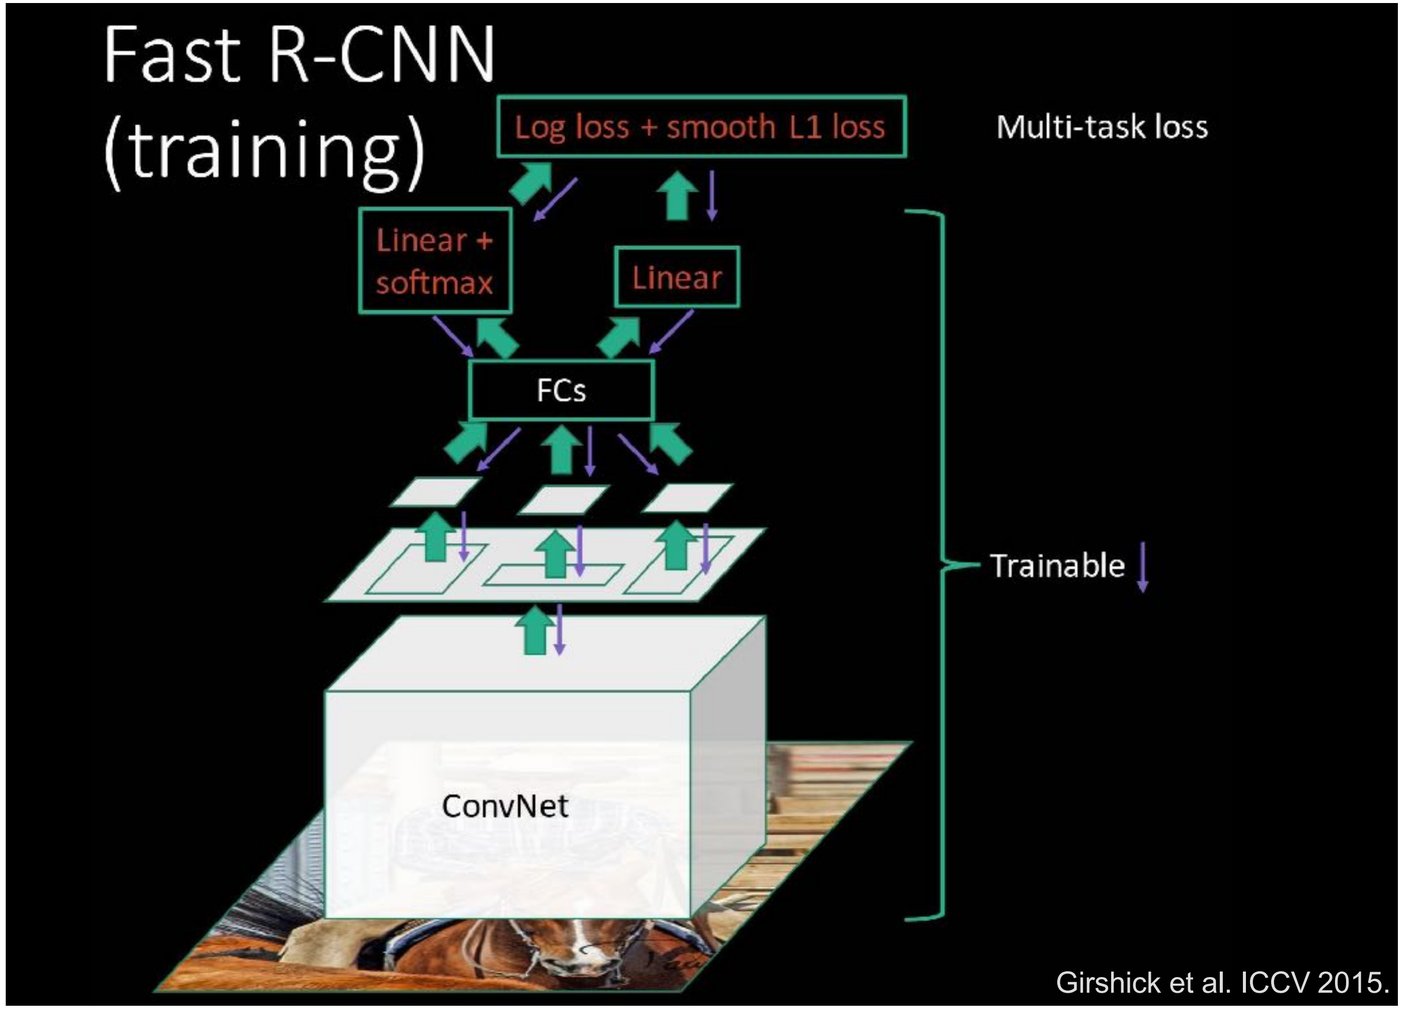
Problem #2: Post-hoc training: **CNN not updated** in response to final classifiers and regressors.
Problem #3: **Complex** training pipeline.



Girshick et al. CVPR14.

Fast R-CNN Solutions

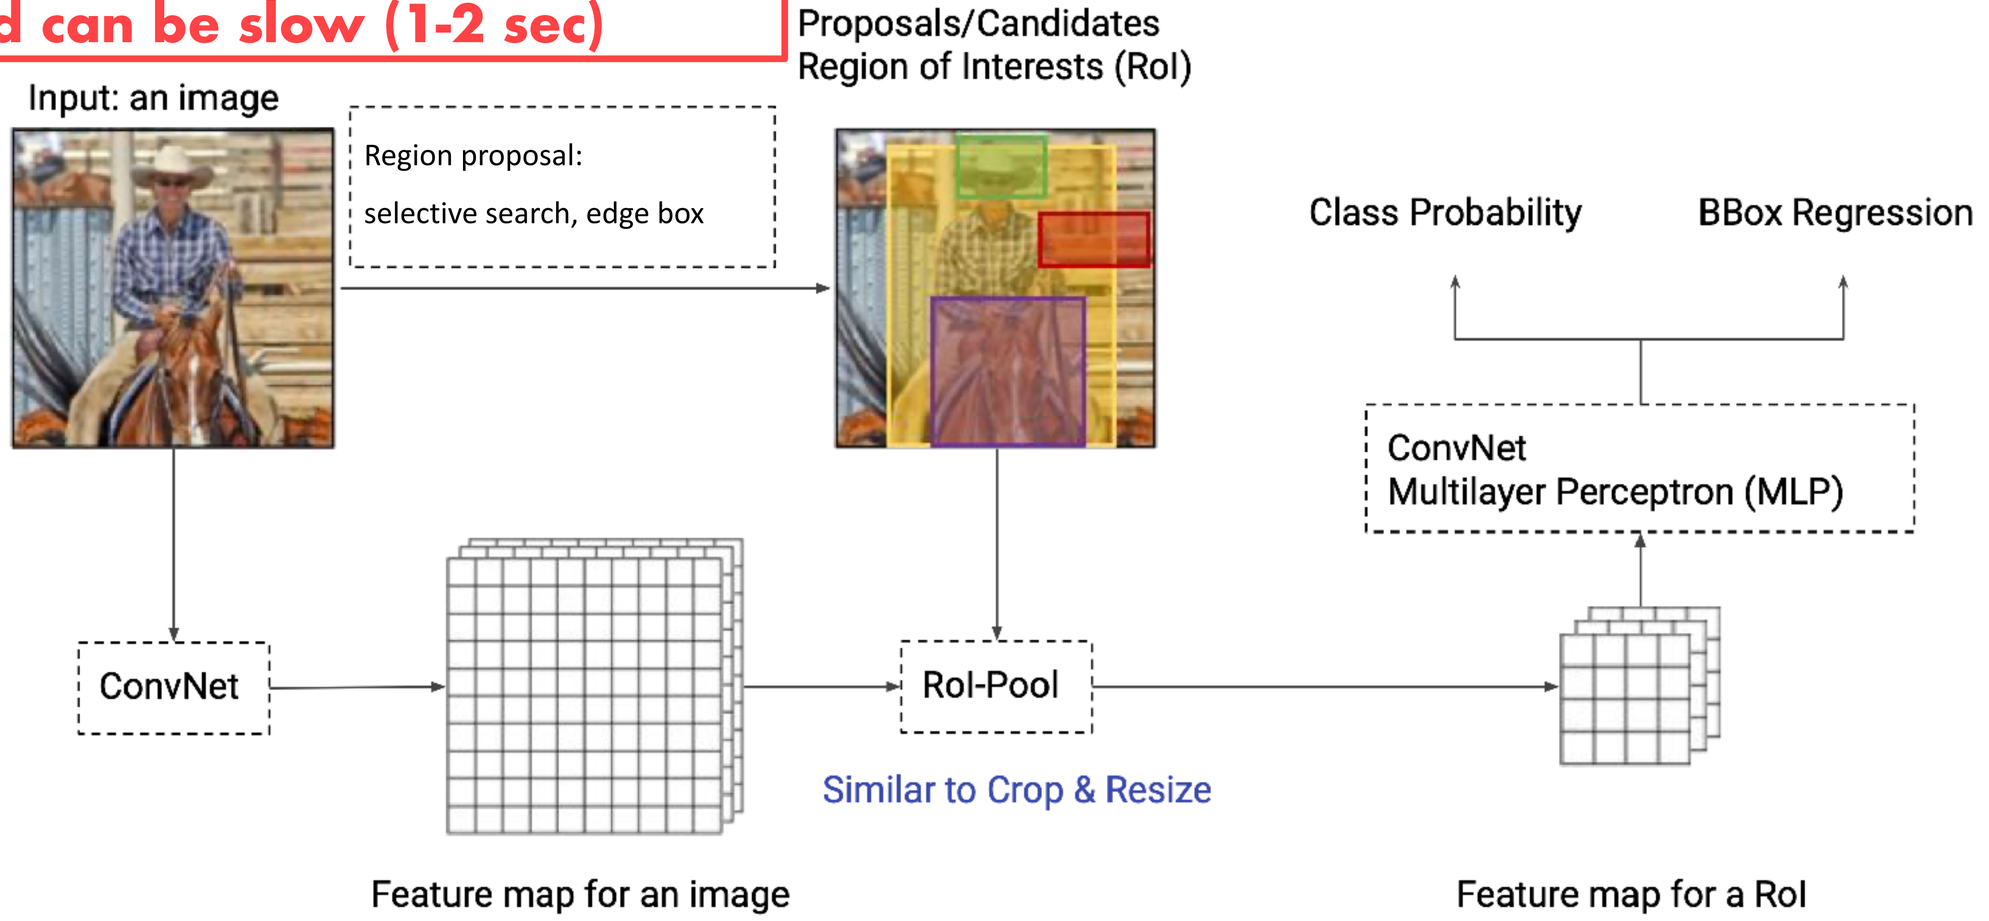
Solution: **Just train the whole system end-to-end all at once!**



Girshick et al. ICCV 2015.

Fast R-CNN [ICCV 2015]

Region proposal is still independent and can be slow (1-2 sec)

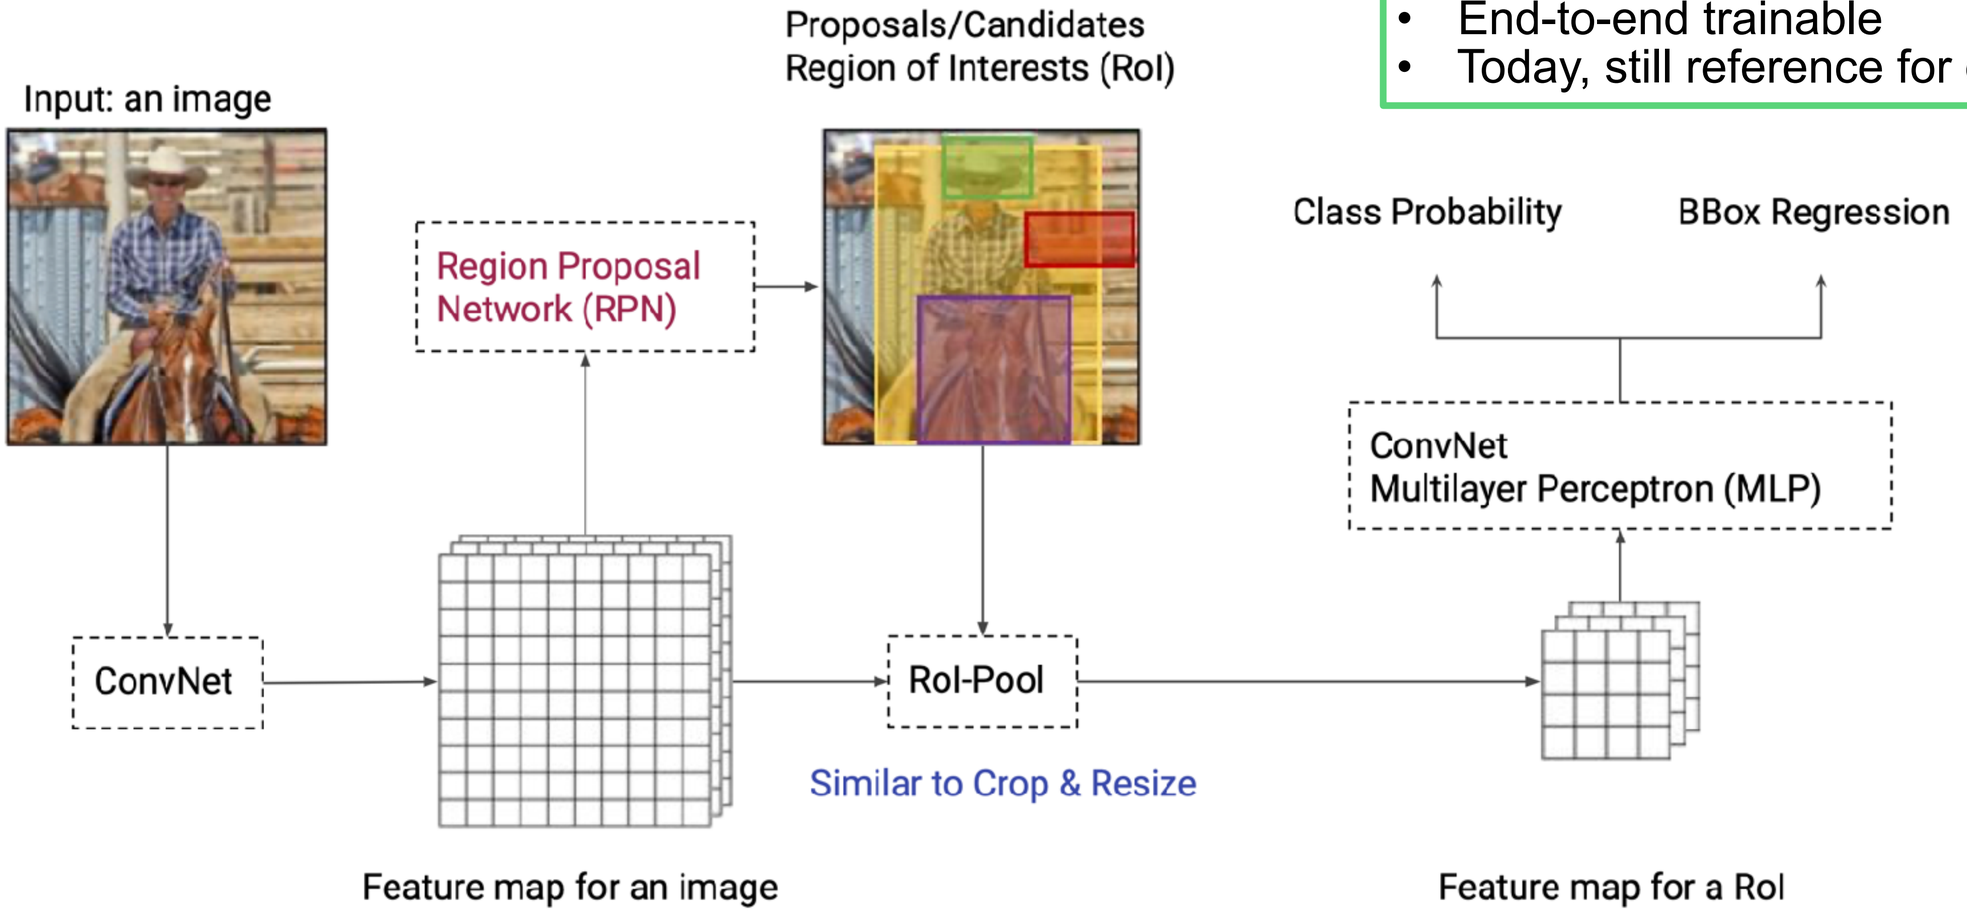


R. Girshick, Fast R-CNN, ICCV 2015

Slides modified from Ross Girshick tutorial at CVPR 2019

Faster R-CNN [NeurIPS 2015]

- Clear boost in performance
- ~ 0.2 sec / image
- End-to-end trainable
- Today, still reference for detection

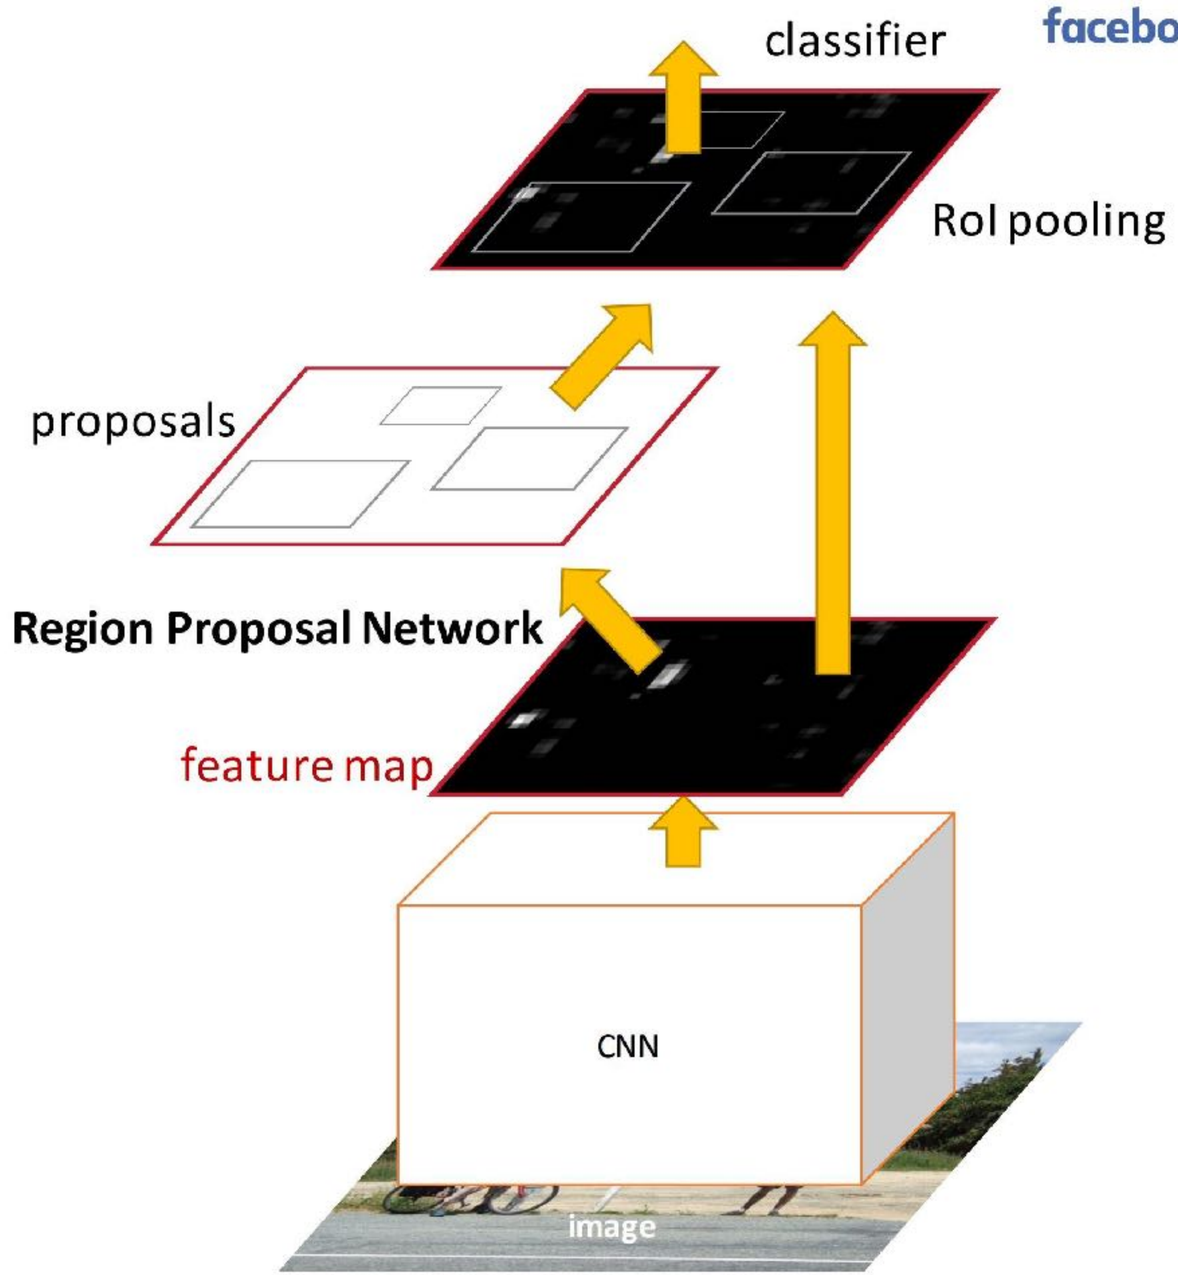


S. Ren, K. He, R. Girshick, and J. Sun, Faster R-CNN: Towards Real-Time Object Detection with Region Proposal Networks, NeurIPS 2015

Slides modified from Ross Girshick tutorial at CVPR 2019

Faster R-CNN

- Insert a **Region Proposal Network (RPN)** after the last convolutional layer.
- RPN trained to produce region proposals directly; no need for external region proposals!
- After RPN, use "RoI Pooling" and an upstream classifier and bbox regressor just like Fast R-CNN.



Slide credit: Ross Girschick

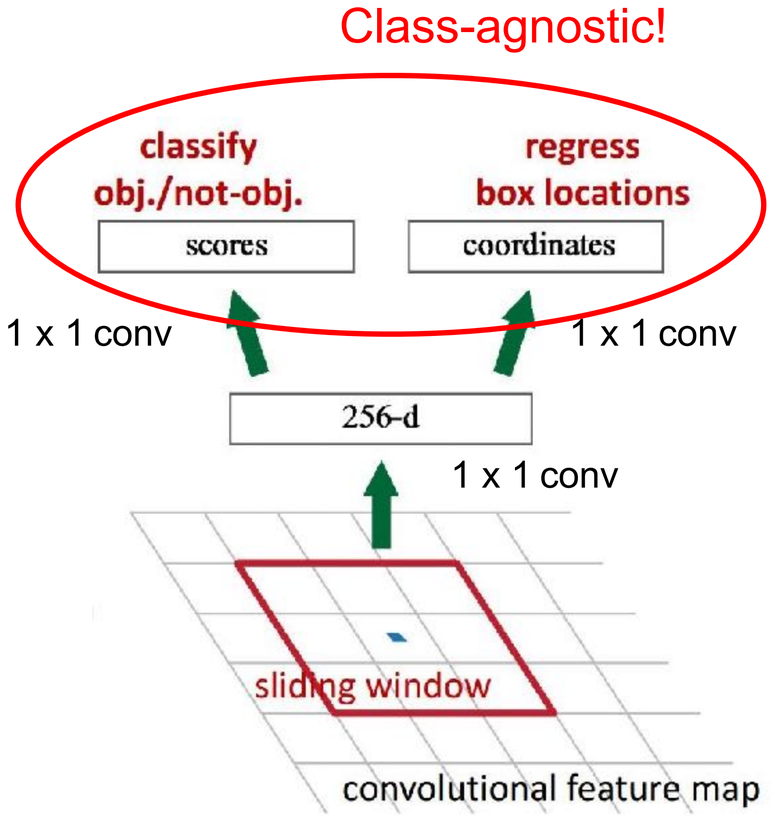
RPN: Region Proposal Network

Slide a small window on the feature map

Build a small network for:
- classifying object or not-object, and
- regressing bbox locations

Position of the sliding window provides localization information with reference to the image

Box regression provides finer localization information with reference to this sliding window



Slide credit: Kaiming He

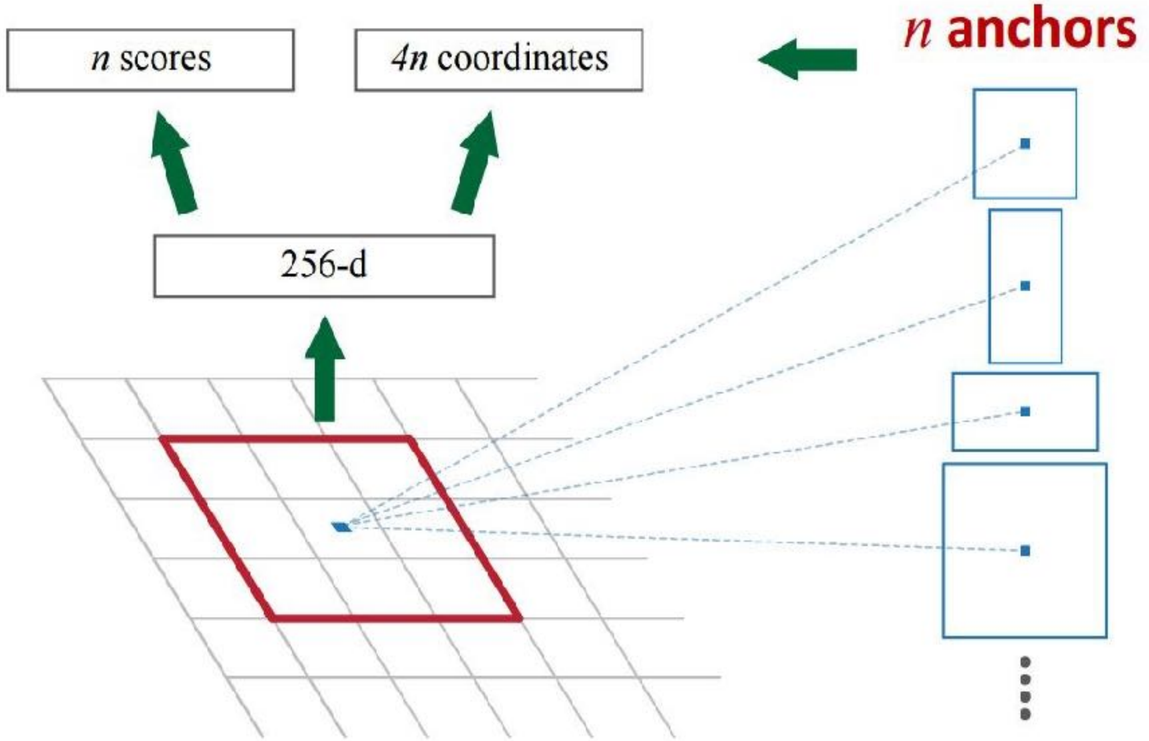
RPN: Region Proposal Network

Use **N anchor boxes** at each location.

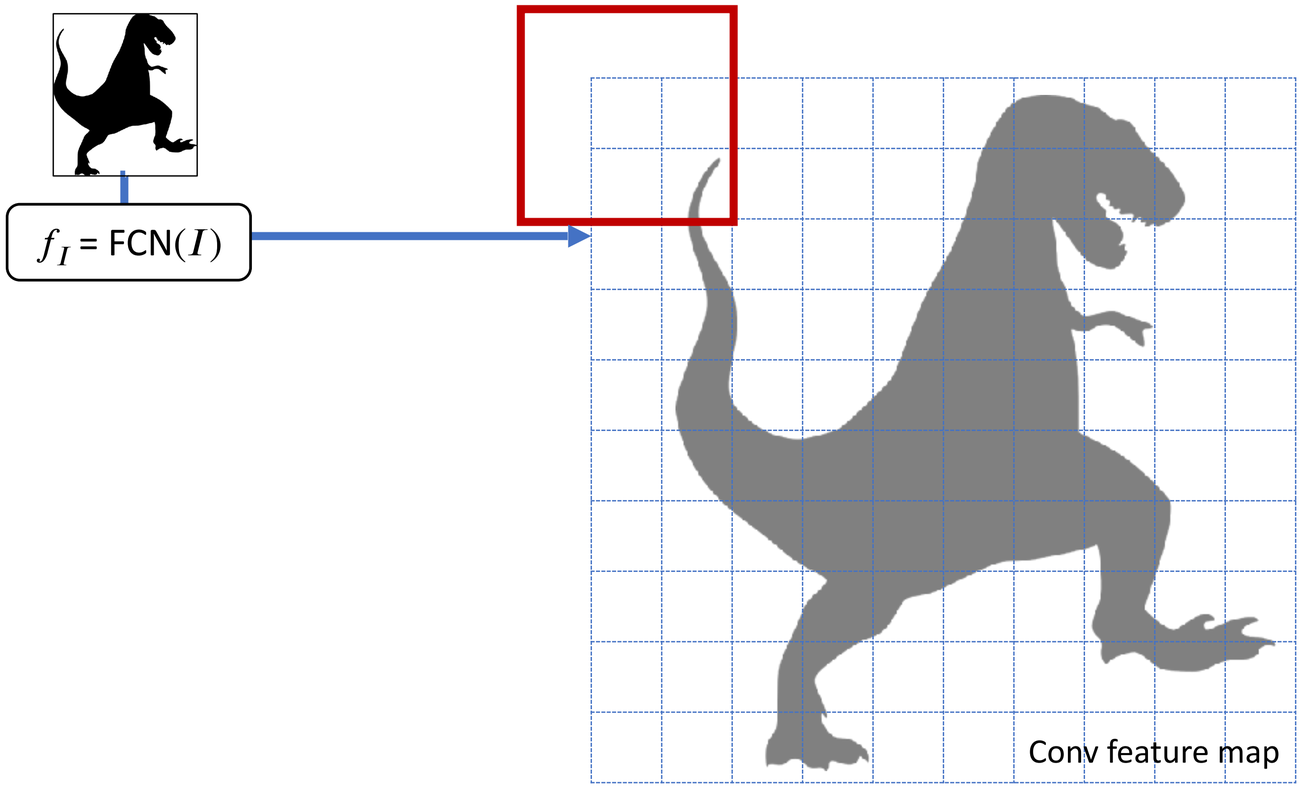
Anchors are **translation invariant**: use the same ones at every location.

Regression gives offsets from anchor boxes.

Classification gives the probability that each (regressed) anchor shows an object.



RPN: Region Proposal Network



Feature Map : 16 x 16 x 256

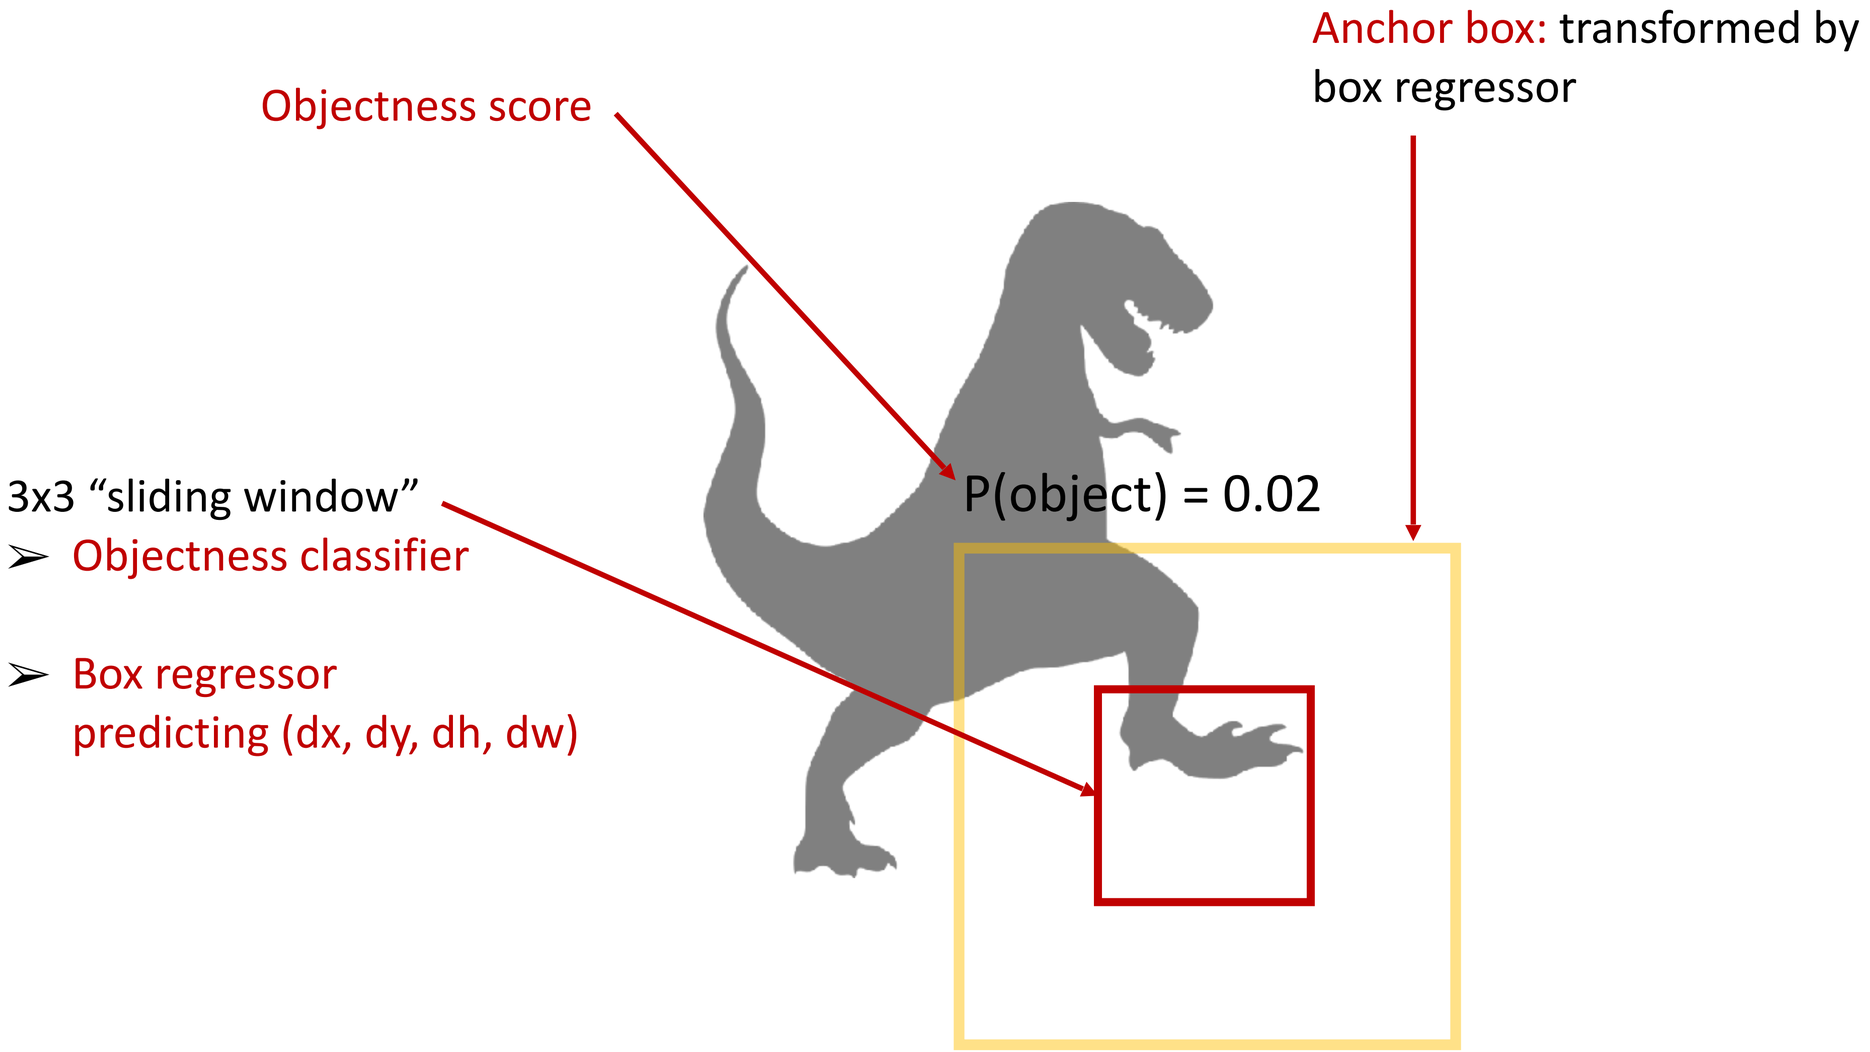
RPN: Prediction (off object)



Slide credit: Ross Girschick

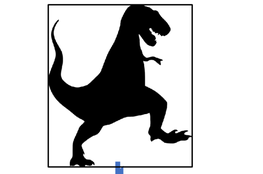
RPN: Multiple Anchors

Y (ground truth) : [1 1 1 1 1 1 0 0 0 0 1 0 0 0 0]

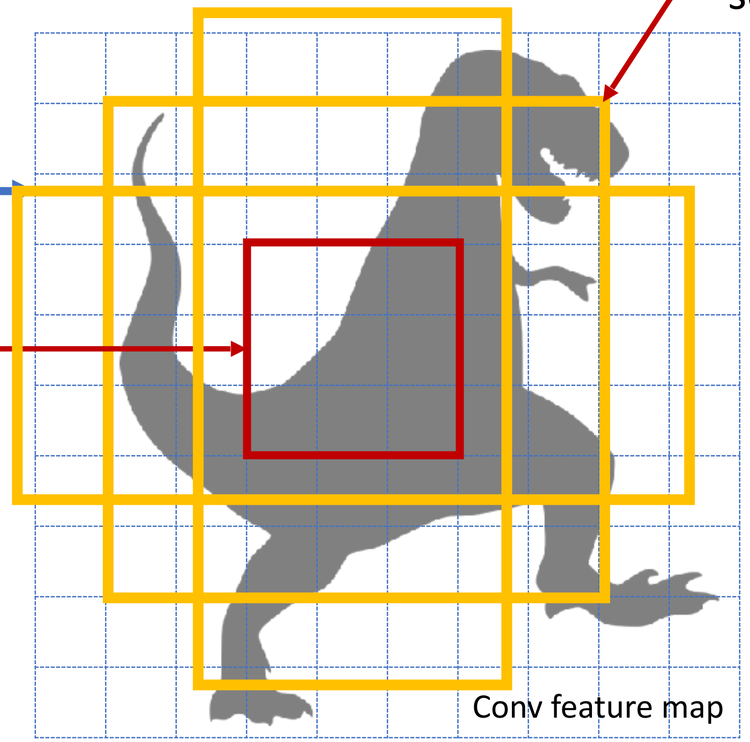
M (mask) : [1 dx dy dh dw 0 - - - - 0 - - - -]

$$Loss = \sum_i M_i \,.\, \mathscr{L}(\hat{Y}_i, Y_i)$$

Anchor boxes: *n* anchors per location with different scales and aspect ratios



f_I = FCN(I)



Feature Map : 16 x 16 x 256

3x3 “sliding window”

➢ *n* objectness classifiers

➢ *n* box regressors

$\hat{Y}$ (output): 16 x 16 x *n* x (1+4)

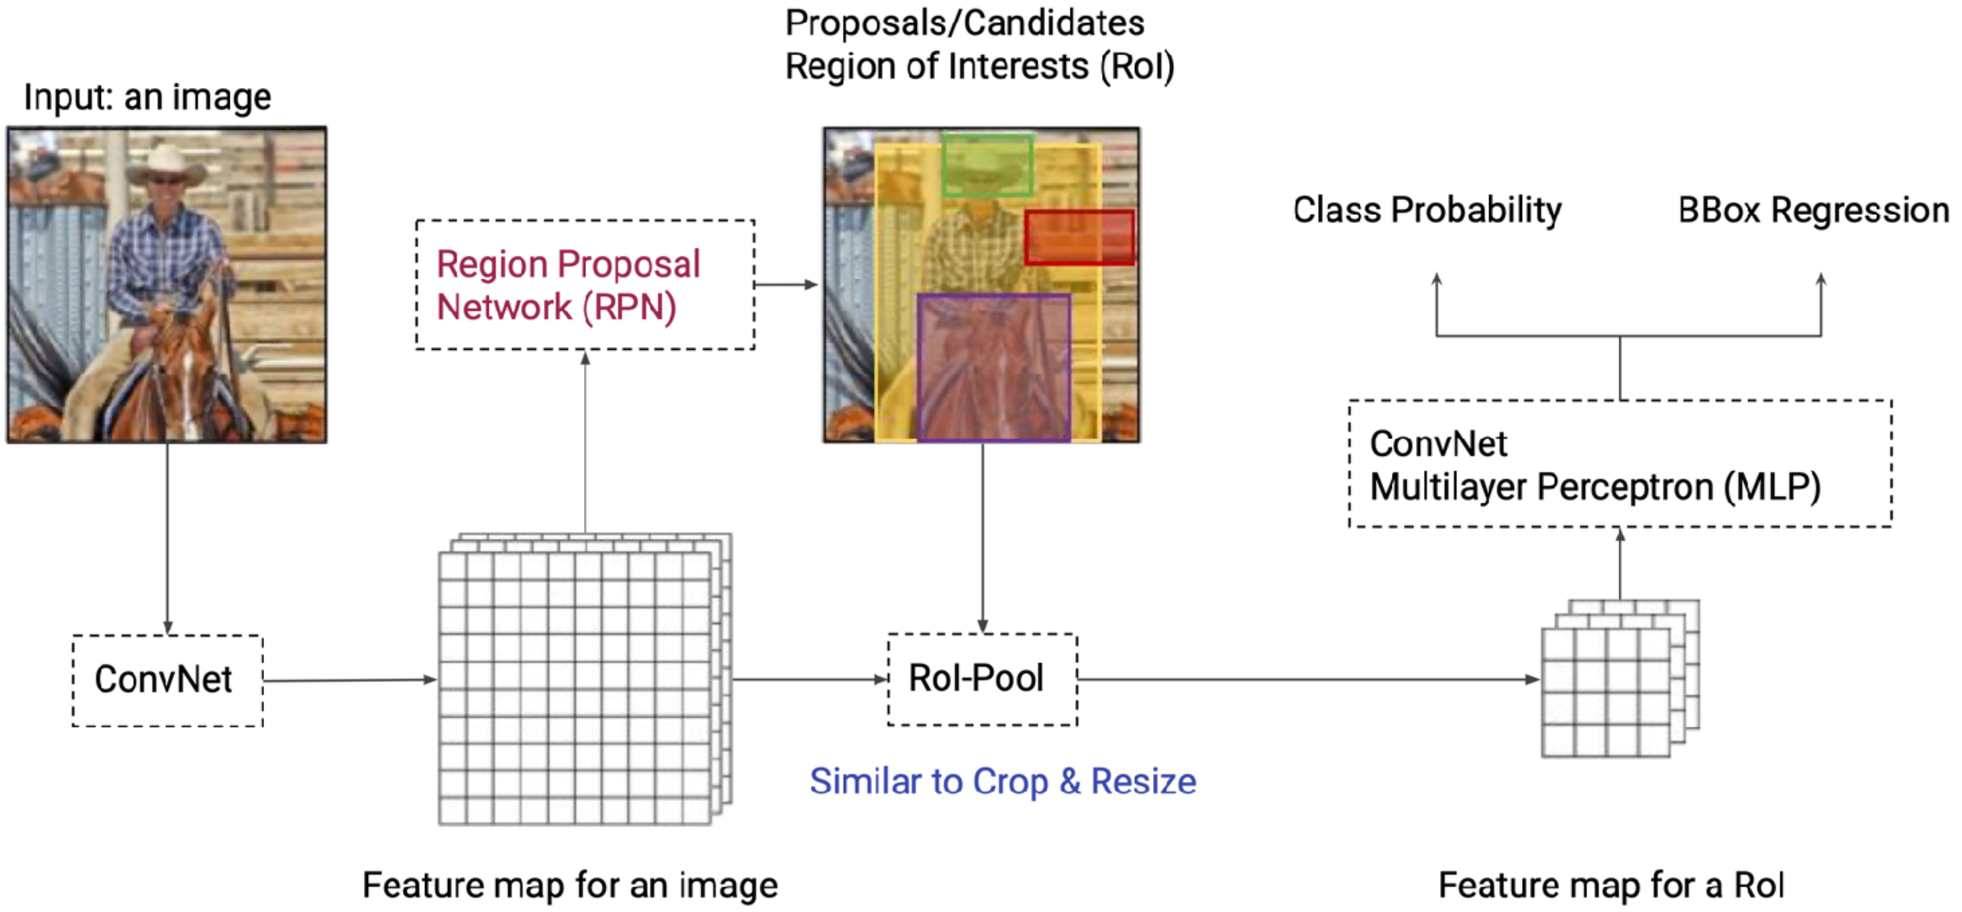
box regression

objectness

#anchors

Faster R-CNN

- Still two-stage



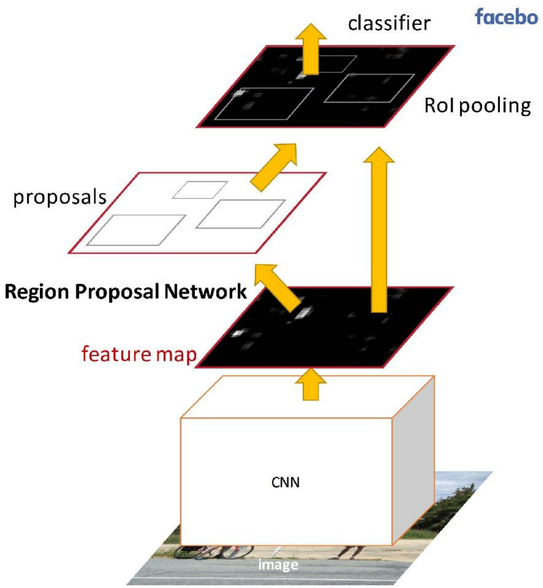
S. Ren, K. He, R. Girshick, and J. Sun, Faster R-CNN: Towards Real-Time Object Detection with Region Proposal Networks, NeurIPS 2015

Slides modified from Ross Girshick tutorial at CVPR 2019

Object detection: 2-stage vs 1-stage

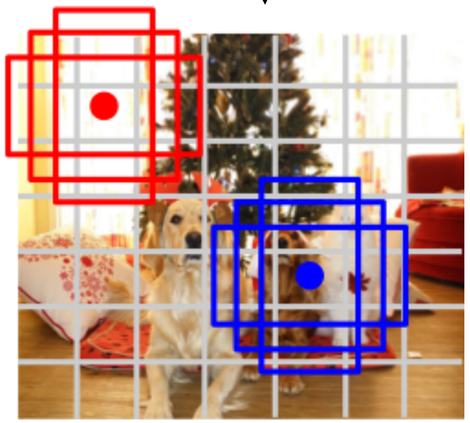
CNN Detectors

2-stage detectors



Fast(er) RCNN, Mask-RCNN, SNIPPER, PANet, TridentNet

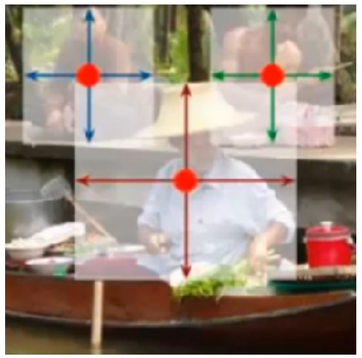
1-stage detectors



- No object proposals
- Use **anchors**
- Faster but less accurate

YOLO, SSD, **RetinaNet**, EfficientDet

Anchor-free detectors



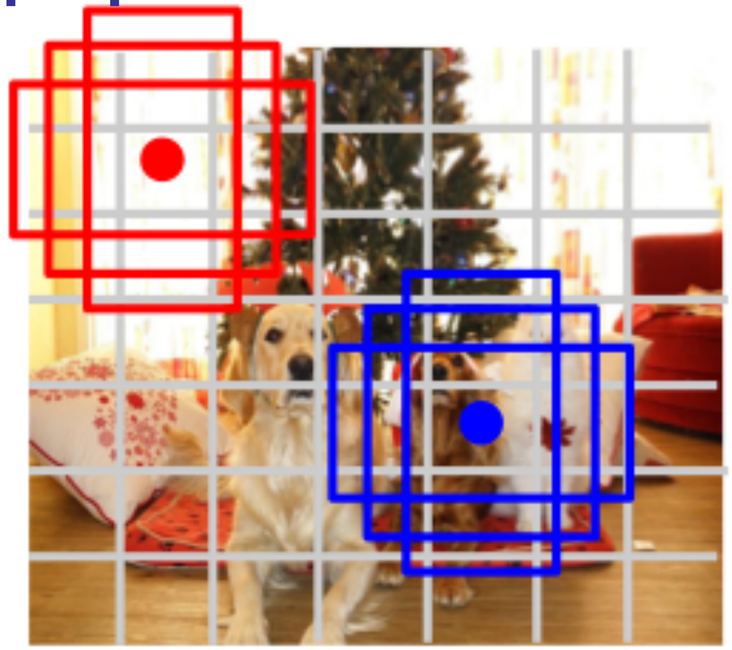
- Use **points**

CornerNet**, CenterNet**, FCOS, ExtremeNet

1-stage object detection: YOLO/SSD

Detection without proposals

Input image
3 x H x W



Divide image into grid
7 x 7

Image a set of **base boxes**
centered at each grid cell
Here B = 3

Redmon et al, "You Only Look Once:
Unified, Real-Time Object Detection", CVPR 2016
Liu et al, "SSD: Single-Shot MultiBox Detector", ECCV 2016

Slide credit: L. Fei Fei, J. Johnson, S. Yeung, http://cs231n.stanford.edu/

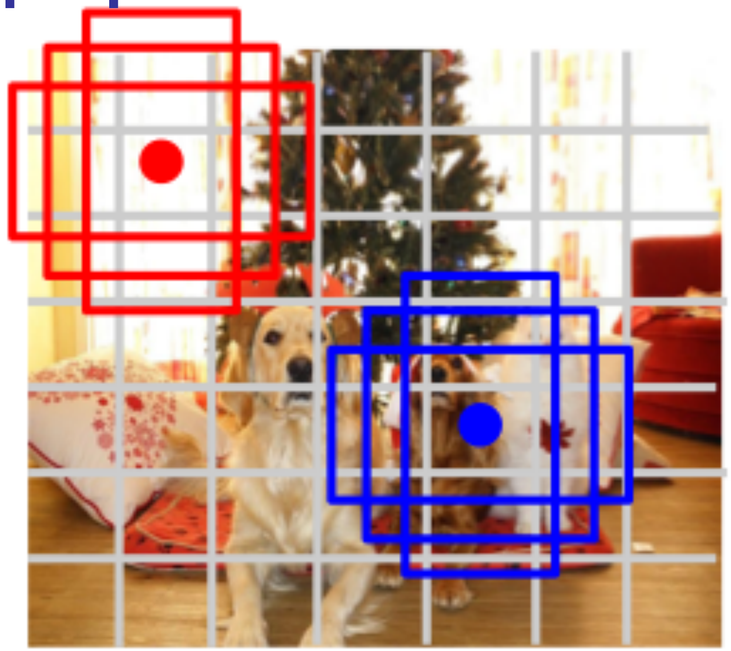
1-stage object detection: YOLO/SSD

Detection without proposals

Within each grid cell:

- Regress from each of the B base boxes to a final box with 5 numbers: (dx, dy, dh, dw, confidence)
- Predict scores for each of C classes (including background as a class)

Output:
7 x 7 x (5 * B + C)



Divide image into grid
7 x 7

Image a set of **base boxes** centered at each grid cell
Here B = 3

From input image to scores with a single network. Faster but not as accurate as RCNN.
See also: Lin et al., Focal loss for dense object detection, ICCV 2017.

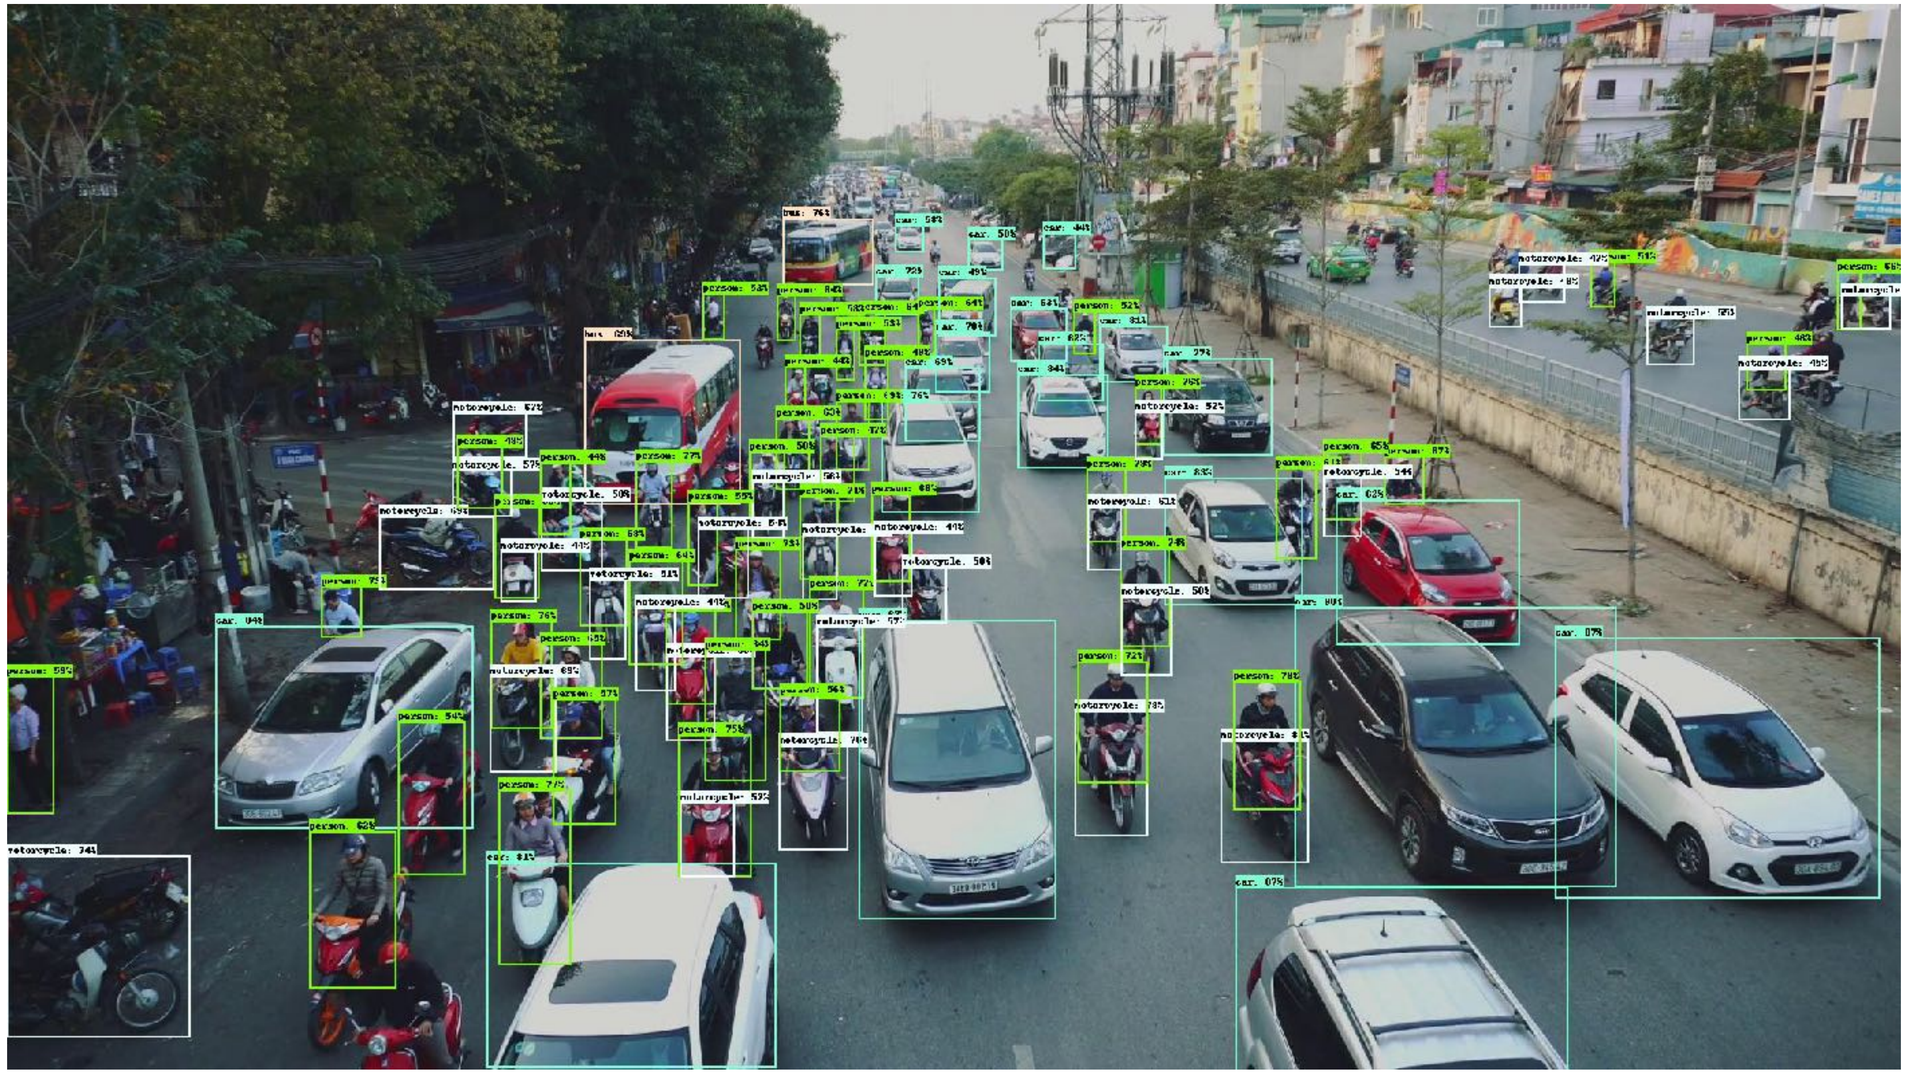
Slide credit: L. Fei Fei, J. Johnson, S. Yeung, http://cs231n.stanford.edu/

Yolo v2 Demo video

[Redmon et al., CVPR'17]

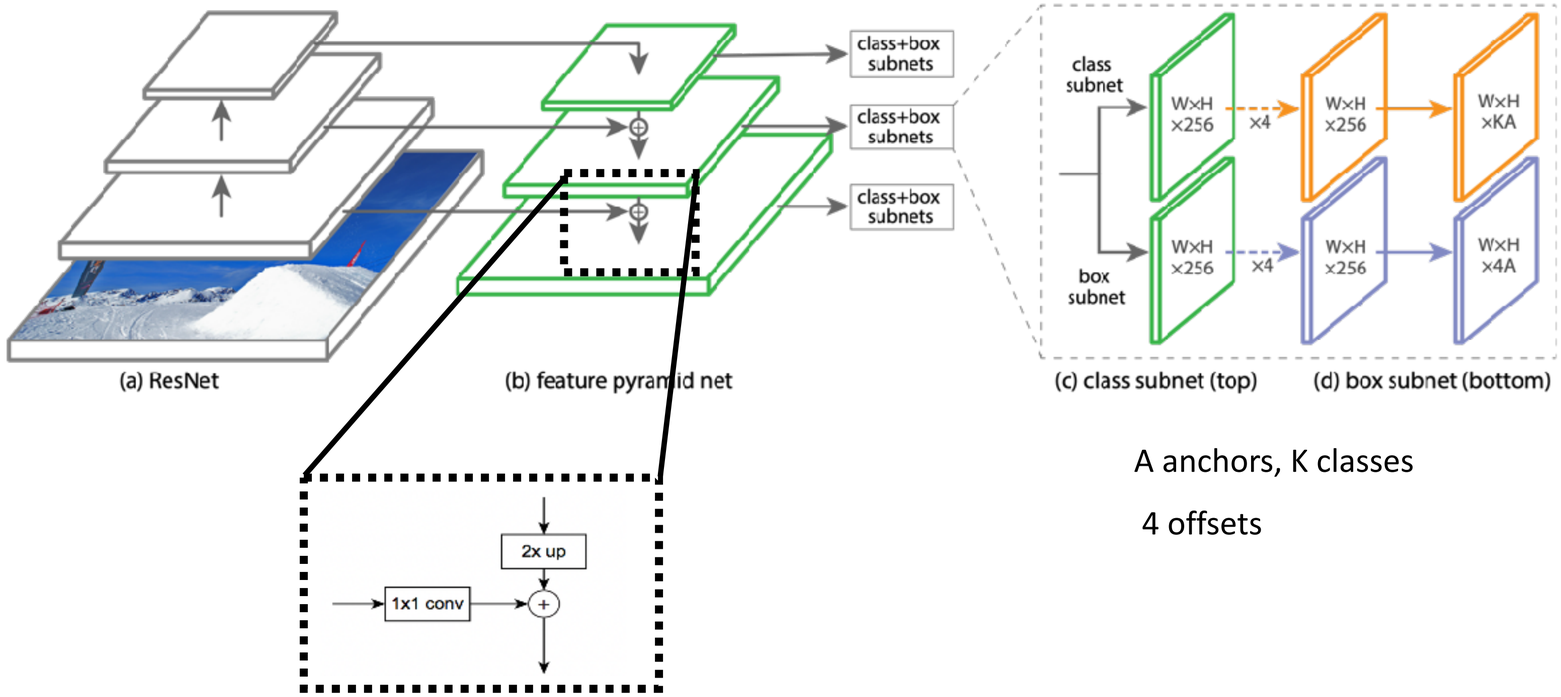
Scale in object detection

Problem with YOLO: Single cell can corresponds to multiple objects, even with multiple anchors, still **too coarse.**



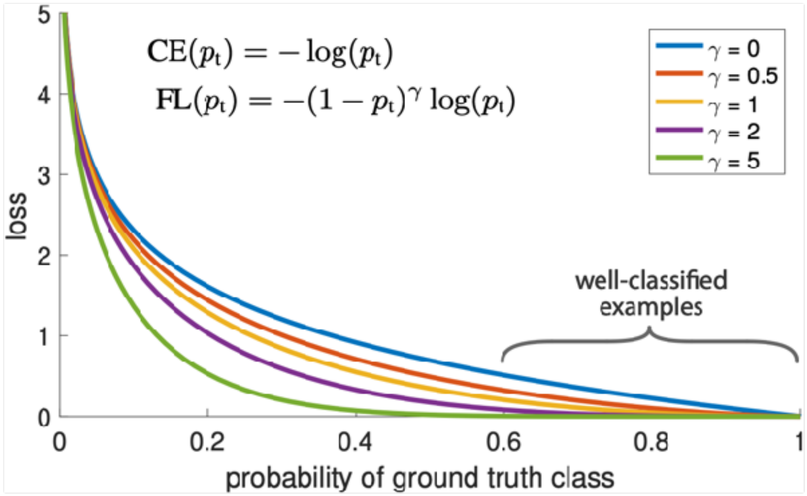
1-stage object detection: RetinaNet

- Pre-define anchor boxes on **multiple scales**, e.g., Feature Pyramid Networks (FPNs).
- 6 anchors per location, 100 - 200k anchor boxes to classify per image (dense detection).
- Focal loss for soft-version hard sample mining.



A anchors, K classes

4 offsets

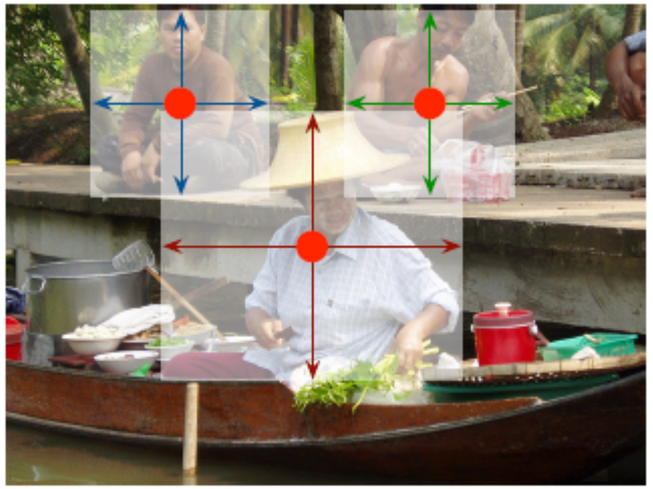


1-stage object detection: CenterNet (anchor-free)

- Represent objects by a single point + (width, height)

- Regress other parameters such as

  - Bounding box
  - 3D box
  - human pose
  - …



Output : 64 x 64 x 1 x (C+2+2)

#keypoints

offsets

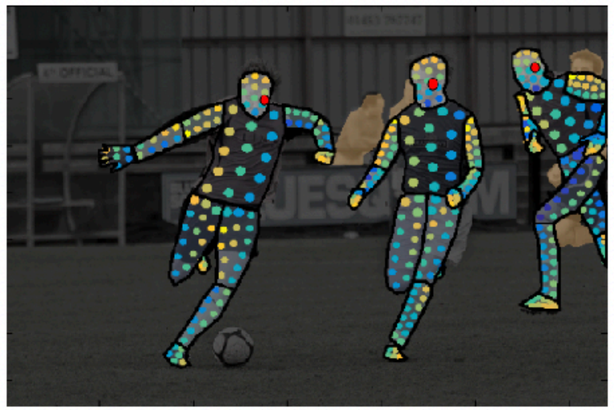
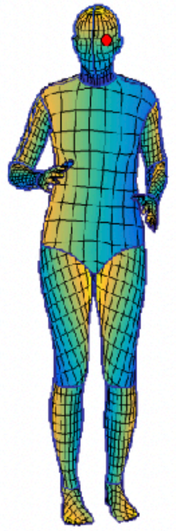
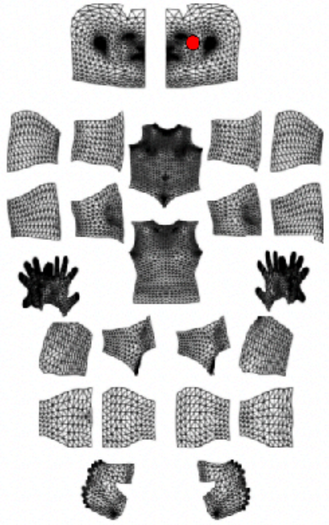
DensePose-RCNN Results

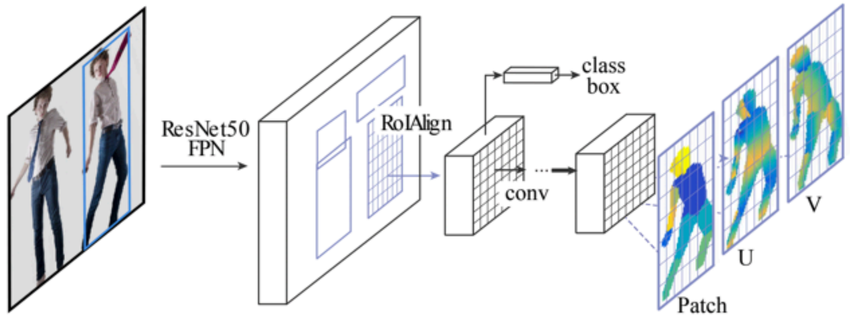






DensePose COCO Dataset

Dense pose estimation aims at mapping all human pixels of an RGB image to the 3D surface of the human body.



regresses to continuous surface coordinates

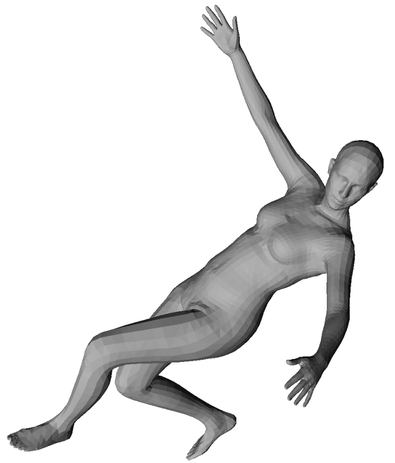
Body depth

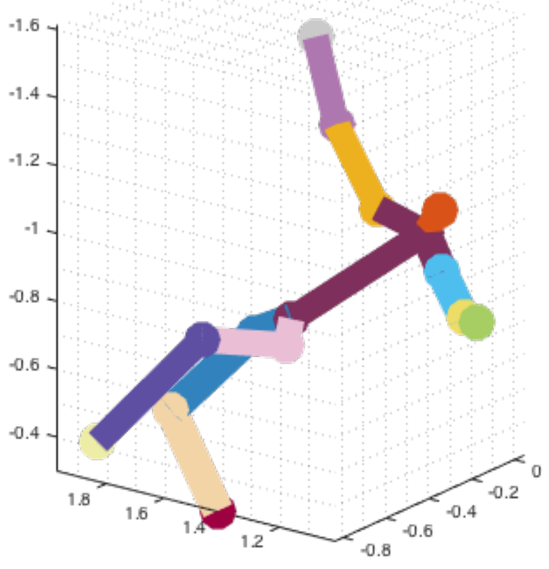
Body shape



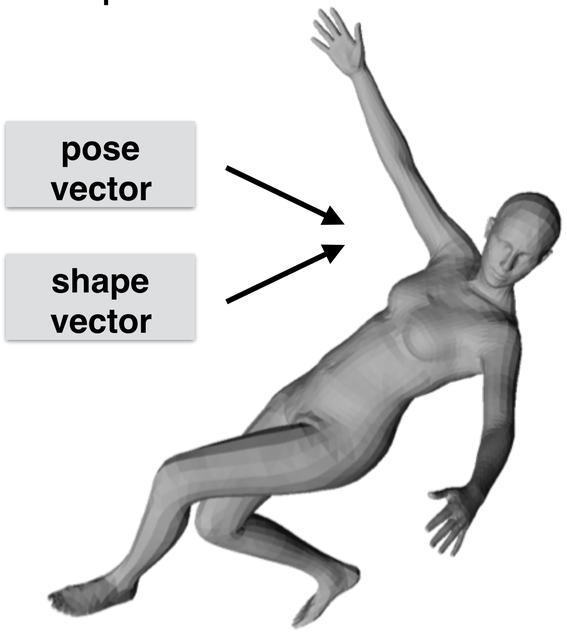
Challenges

How to model the body shape?

(a) Skeleton representation

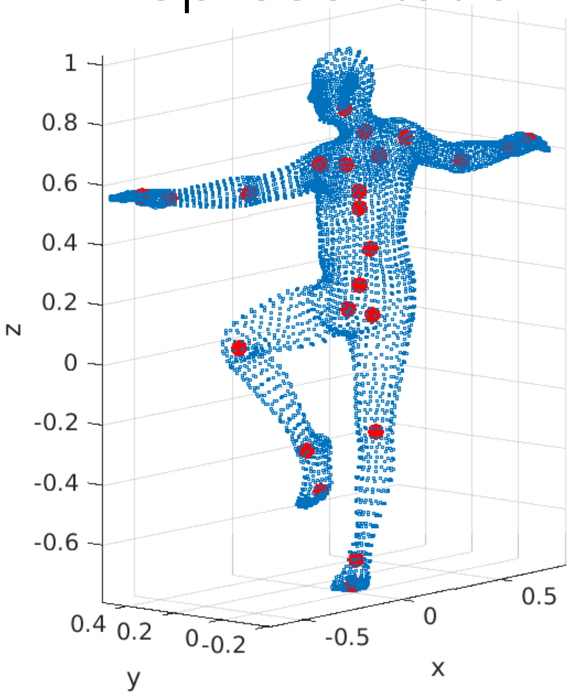


(b) Parametric representation

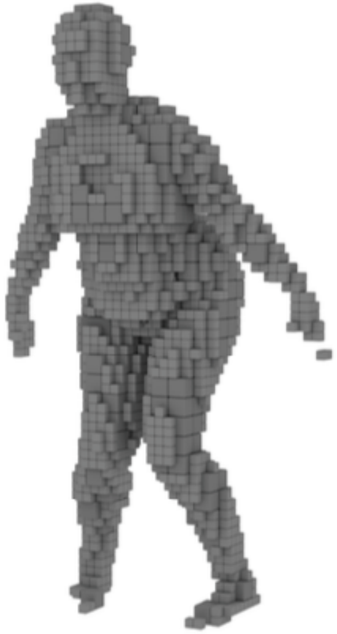


Loper et al. [1]

(c) Point cloud representation



(d) Voxel representation



Tatarchenko et al. [2]

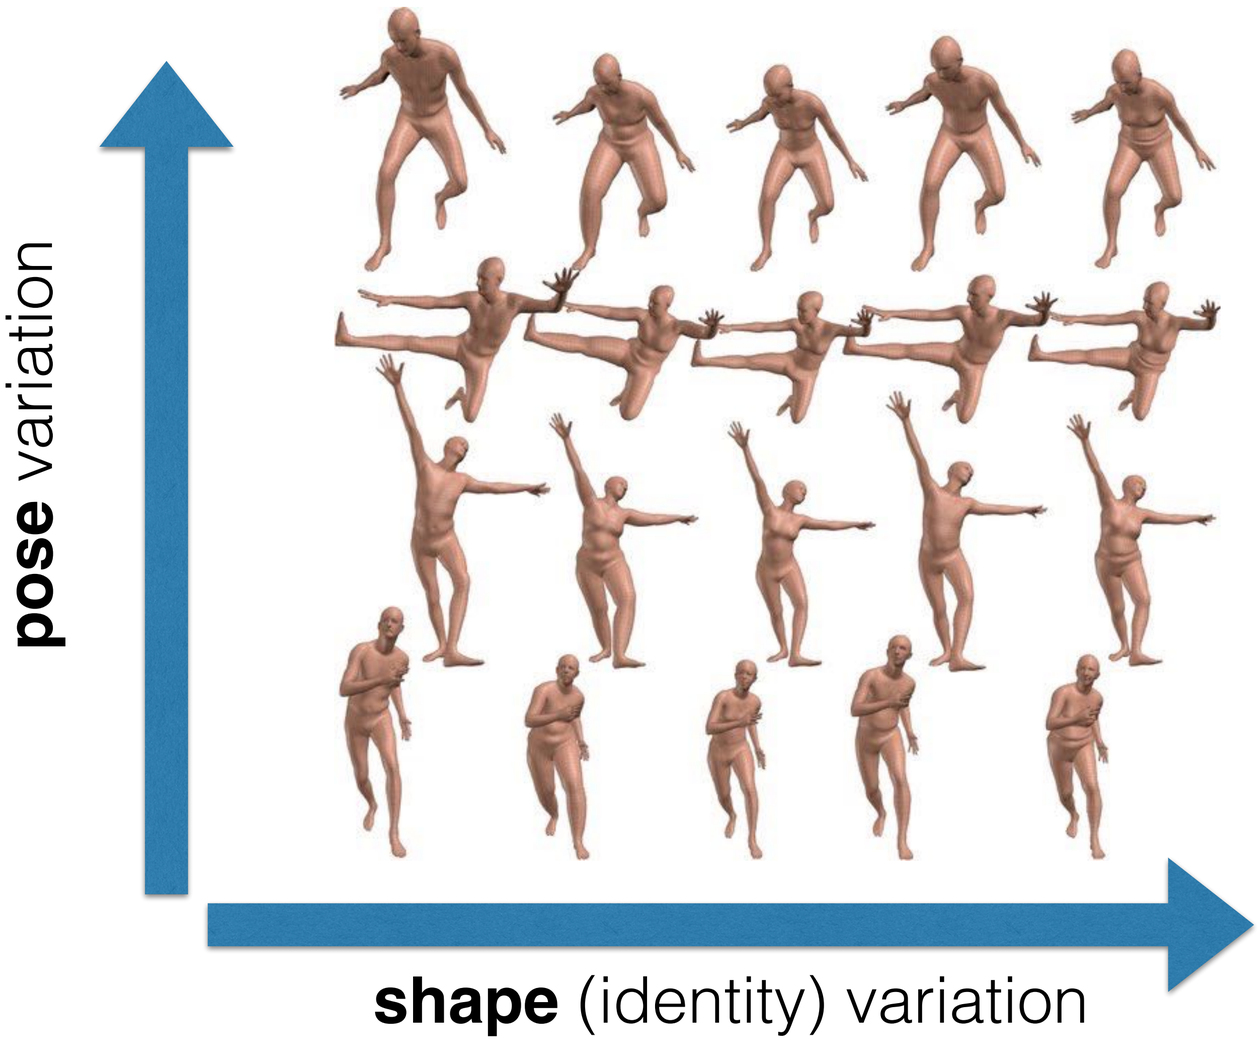
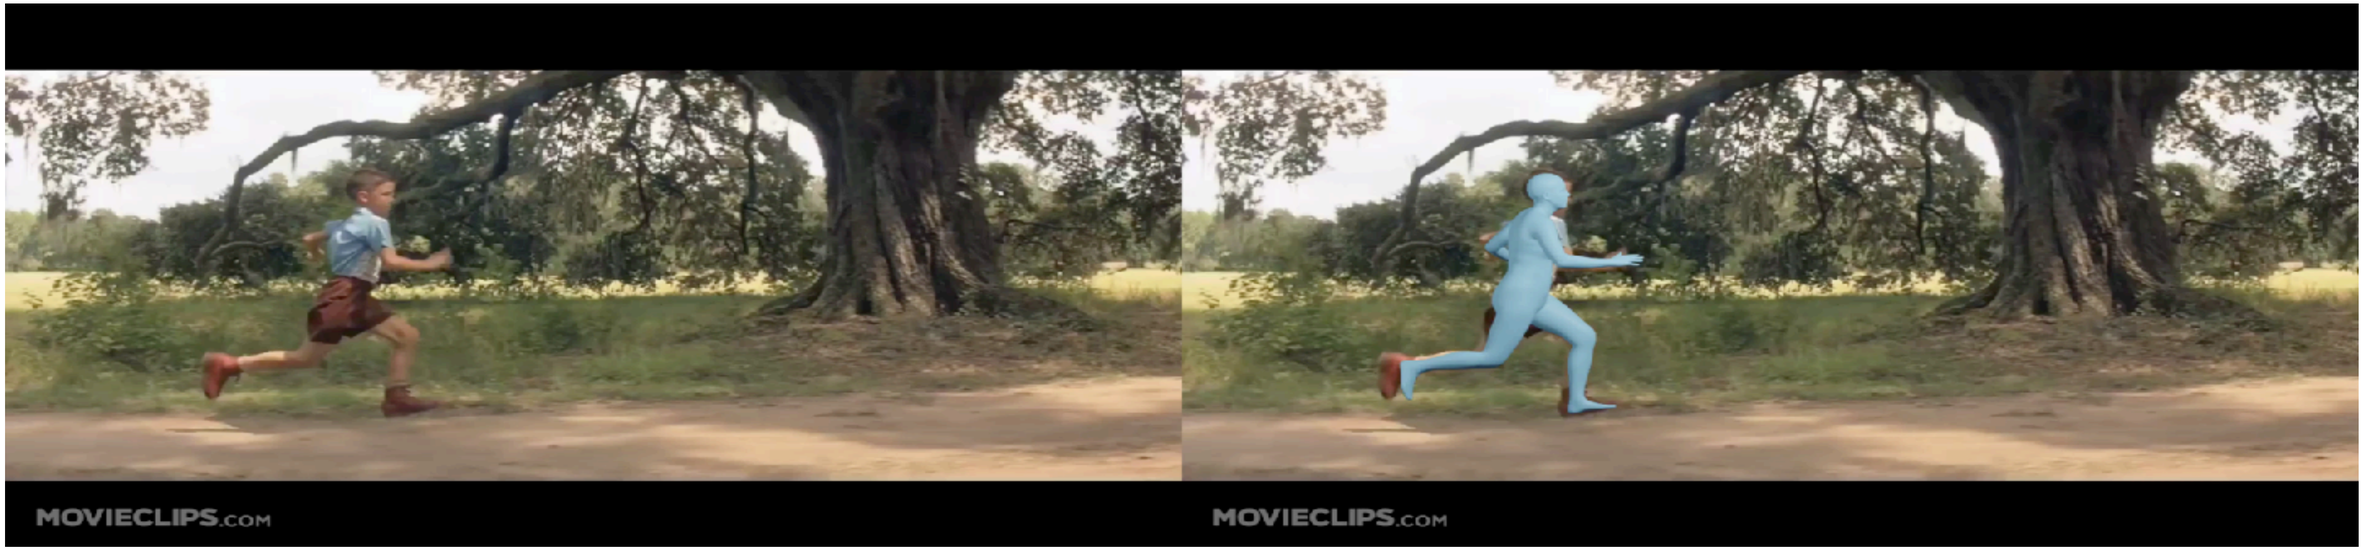
SMPL parametric body model: surface & joints



[Loper et al. 2015]

Human pose estimation beyond 2D keypoints

- A rich literature also on 3D human pose & motion estimation



VIBE [Kocabas et al. CVPR 2020]

Human pose estimation beyond 2D keypoints

- A rich literature also on 3D human pose & motion estimation

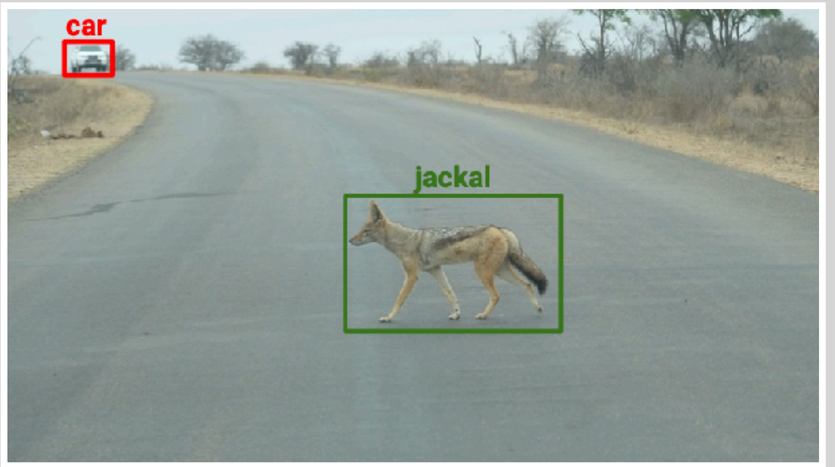
4D Humans [Goel et al. ICCV 2023]

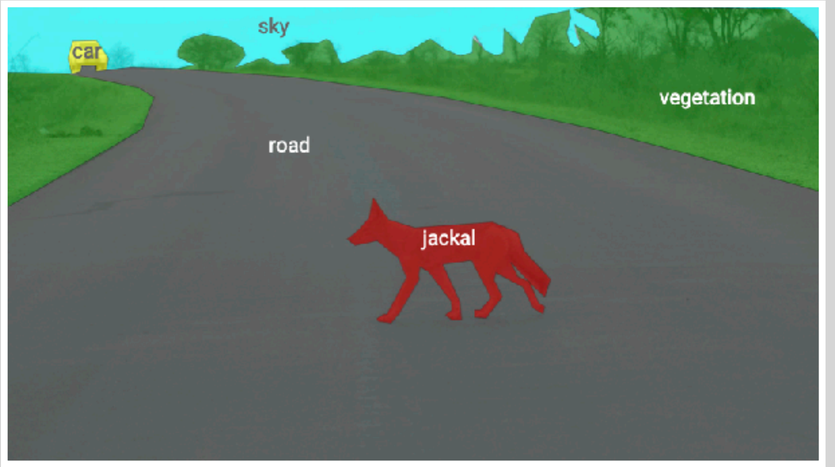
1. Beyond CNNs

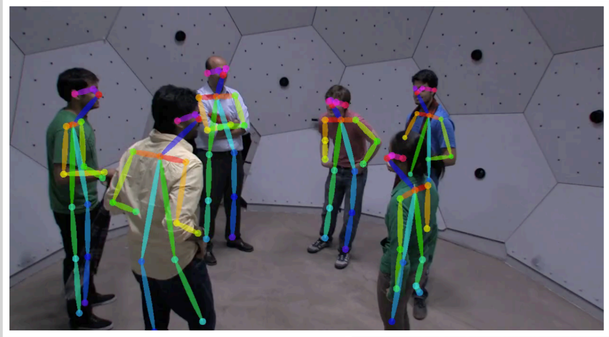
- Attention & Transformer
- Vision Transformers

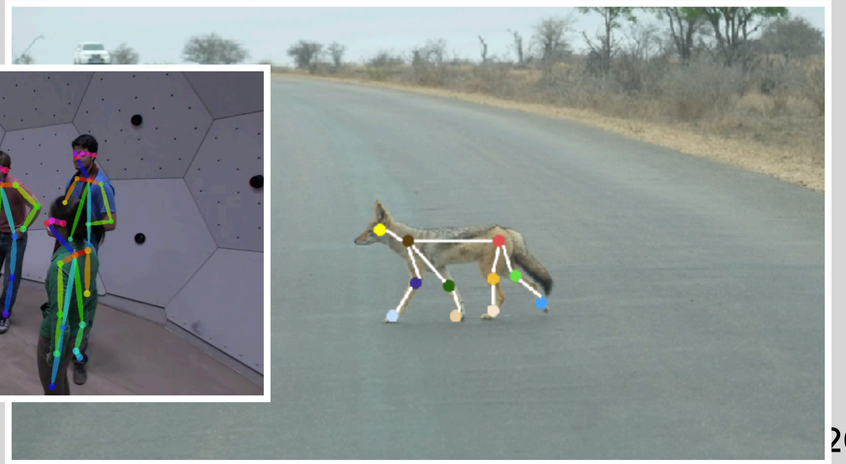
2. Beyond classification

- a. Intro to structured outputs
- b. Object detection (localization)
- c. Segmentation
- d. Human pose estimation









Key elements of DL for CV

Initially in CV

Next in CV

These days in CV !

ML community

1. Model (i.e., architectural definition of connectivity and learnable parameters)
2. Loss
3. Data
4. Optimization algorithm (i.e., variations of SGD)
